1 Module Index

1.1 Modules

Here is a list of all modules:

Algorithms classes	11
Tools	18
Criteria	47
Date conversion classes	64
File services	65
Parameters	66
Date conversion C APIs	68
C API for reading data	76
Date conversion Fortran APIs	78
Fortran API for reading data	90

2 Namespace Index

2.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

brathl	92
---------------	-----------

3 Class Index

3.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

_structDateDSM	99
_structDateJulian	100

<code>_structDateSecond</code>	101
<code>_structDateYMDHMSM</code>	101
<code>bratl::CBratAlgoFilterGaussian1D</code>	102

6.1.1 Detailed Description

6.1.2 Function Documentation

6.1.2.1 **bratl::CBratAlgorithmGeosVelGrid::CBratAlgorithmGeosVelGrid ()**

Default constructor

6.1.2.2 **bratl::CBratAlgorithmGeosVelGrid::CBratAlgorithmGeosVelGrid (const CBratAlgorithmGeosVelGrid & copy)**

Copy constructor

6.1.2.3 **bratl::CBratAlgorithmGeosVelGridU::CBratAlgorithmGeosVelGridU ()**

Default constructor

6.1.2.4 **bratl::CBratAlgorithmGeosVelGridU::CBratAlgorithmGeosVelGridU (const CBratAlgorithmGeosVelGridU & copy)**

Copy constructor

6.1.2.5 **bratl::CBratAlgorithmGeosVelGridV::CBratAlgorithmGeosVelGridV ()**

Default constructor

6.1.2.6 **bratl::CBratAlgorithmGeosVelGridV::CBratAlgorithmGeosVelGridV (const CBratAlgorithmGeosVelGridV & copy)**

Copy constructor

6.1.2.7 **void bratl::CBratAlgorithmGeosVelGrid::Dump (std::ostream & fOut = std::cerr) [override], [virtual]**

Dump function

Reimplemented from **bratl::CBratAlgorithmGeosVel** (p. 129).

Reimplemented in **bratl::CBratAlgorithmGeosVelGridV** (p. 15), and **bratl::CBratAlgorithmGeosVelGridU** (p. 15).

References **bratl::CBratAlgorithmGeosVel::Dump()**.

Referenced by **bratl::CBratAlgorithmGeosVelGridU::Dump()**, and **bratl::CBratAlgorithmGeosVelGridV::Dump()**.

6.1.2.8 `void bratl::CBratAlgorithmGeosVelGridU::Dump (std::ostream & fOut = std::cerr) [override], [virtual]`

Dump function

Reimplemented from **bratl::CBratAlgorithmGeosVelGrid** (p. 14).

References **bratl::CBratAlgorithmGeosVelGrid::Dump()**.

6.1.2.9 `void bratl::CBratAlgorithmGeosVelGridV::Dump (std::ostream & fOut = std::cerr) [override], [virtual]`

Dump function

Reimplemented from **bratl::CBratAlgorithmGeosVelGrid** (p. 14).

References **bratl::CBratAlgorithmGeosVelGrid::Dump()**.

6.1.2.10 `virtual std::string bratl::CBratAlgorithmGeosVelGridU::GetDescription () const [inline], [override], [virtual]`

Gets the description of the algorithm

Implements **bratl::CBratAlgorithmBase** (p. 125).

6.1.2.11 `virtual std::string bratl::CBratAlgorithmGeosVelGridV::GetDescription () const [inline], [override], [virtual]`

Gets the description of the algorithm

Implements **bratl::CBratAlgorithmBase** (p. 125).

6.1.2.12 `virtual std::string bratl::CBratAlgorithmGeosVelGrid::GetInputParamDesc (uint32_t indexParam) const [inline], [override], [virtual]`

Gets the description of an input parameter.

Parameters

<i>indexParam</i>	[in] : parameter index. First parameter index is 0, last one is 'number of parameters - 1'.
-------------------	---

Implements **bratl::CBratAlgorithmBase** (p. 125).

References **bratl::CTools::Format()**.

6.1.2.13 `virtual CBratAlgorithmParam::bratAlgoParamTypeVal bratl::CBratAlgorithmGeosVelGrid::GetInputParamFormat (uint32_t indexParam) const [inline], [override], [virtual]`

Gets the format of an input parameter : **CBratAlgorithmParam::T_DOUBLE** for double **CBratAlgorithmParam::T_FLOAT** for float **CBratAlgorithmParam::T_INT** for integer **CBratAlgorithmParam::T_LONG** for long integer **CBratAlgorithmParam::T_STRING** for `std::string` **CBratAlgorithmParam::T_CHAR** for a character

Parameters

<i>indexParam</i>	[in] : parameter index. First parameter index is 0, last one is 'number of parameters - 1'.
-------------------	---

Implements **bratl::CBratAlgorithmBase** (p. 125).

References **bratl::CTools::Format()**.

6.1.2.14 `virtual std::string bratl::CBratAlgorithmGeosVelGrid::GetInputParamUnit (uint32_t indexParam) const [inline], [override], [virtual]`

Gets the unit of an input parameter :

Parameters

<i>indexParam</i>	[in] : parameter index.
-------------------	-------------------------

Implements **bratl::CBratAlgorithmBase** (p. 125).

References **bratl::CTools::Format()**.

6.1.2.15 `virtual std::string bratl::CBratAlgorithmGeosVelGridU::GetName () const [inline],[override],[virtual]`

Gets the name of the algorithm

Implements **bratl::CBratAlgorithmBase** (p. 125).

6.1.2.16 `virtual std::string bratl::CBratAlgorithmGeosVelGridV::GetName () const [inline],[override],[virtual]`

Gets the name of the algorithm

Implements **bratl::CBratAlgorithmBase** (p. 125).

6.1.2.17 `virtual uint32_t bratl::CBratAlgorithmGeosVelGrid::GetNumInputParam () const [inline],[override],[virtual]`

Gets the number of input parameters to pass to the 'Run' function

Implements **bratl::CBratAlgorithmBase** (p. 126).

6.1.2.18 `virtual std::string bratl::CBratAlgorithmGeosVelGrid::GetOutputUnit () const [inline],[override],[virtual]`

Gets the unit of an output value returned by the 'Run' function.

Parameters

<i>indexParam</i>	[in] : parameter index.
-------------------	-------------------------

Implements **bratl::CBratAlgorithmBase** (p. 126).

6.1.2.19 `CBratAlgorithmGeosVelGrid & bratl::CBratAlgorithmGeosVelGrid::operator= (const CBratAlgorithmGeosVelGrid & copy)`

Overloads operator '='

6.1.2.20 `double bratl::CBratAlgorithmGeosVelGrid::Run (CVectorBratAlgorithmParam & args) [override],[virtual]`

Runs the algorithm

Parameters

<i>fmt</i>	[in] : a std::string that indicates the format of each value of input parameters (number, std::string) : d for integer l for long integer f for double s for std::string
<i>args</i>	[in] : the values of input parameters i(a C/C++ va_list).

Returns

the result of the execution

Implements **bratl::CBratAlgorithmBase** (p. 126).

6.1.2.21 **bratl::CBratAlgorithmGeosVelGrid::~CBratAlgorithmGeosVelGrid** () [virtual]

Destructor

6.1.2.22 **bratl::CBratAlgorithmGeosVelGridU::~CBratAlgorithmGeosVelGridU** () [virtual]

Destructor

6.1.2.23 **bratl::CBratAlgorithmGeosVelGridV::~CBratAlgorithmGeosVelGridV** () [virtual]

Destructor

6.2.1 Detailed Description

6.2.2 Macro Definition Documentation

6.2.2.1 #define FILL_VALUE_ATTR "_FillValue"

NetCDF files access.

Version

1.0

6.2.3 Typedef Documentation

6.2.3.1 `typedef std::vector<doubleptrarray> brathl::arraydoubleptrarray`

An array (std::vector) of std::vector of double pointer

Version

1.0

Creates a type name for array of DoublePtr array

6.2.3.2 `typedef std::vector<double> brathl::doublearray`

An array (std::vector) of std::vector of double

Version

1.0

Creates a type name for array of double array

6.2.3.3 `typedef std::map<std::string, CStringArray> brathl::maparraystring`

a set of array std::string value management classes.

Version

1.0

Creates a type name for std::map of std::string array

6.2.4 Function Documentation

6.2.4.1 `CExternalFiles * brathl::BuildExistingExternalFileKind (const std::string & path)`

External files access.

Version

1.0

6.2.4.2 `CInternalFiles * brathl::BuildExistingInternalFileKind (const std::string & name, const CStringArray * fieldNames = NULL)`

Internal files access.

Version

1.0

References brathl::CTools::Format().

6.2.4.3 `brathl::CIntList::CIntList (const CIntList & list)`

Creates new **CIntList** (p. 251) object from another **CStringList** (p. 307)

Parameters

<i>std::list</i>	[in] : std::list to be copied
------------------	-------------------------------

6.2.4.4 brathl::CObArray::CObArray (const CObArray & vect)

Creates new **CObArray** (p. 257) object from another **CObArray** (p. 257)

Parameters

<i>vect</i>	[in] : std::list to be copied
-------------	-------------------------------

6.2.4.5 brathl::CObList::CObList (const CObList & lst)

Creates new **CObList** (p. 259) object from another **CStringList** (p. 307)

Parameters

<i>lst</i>	[in] : std::list to be copied
------------	-------------------------------

6.2.4.6 brathl::CStringList::CStringList (const CStringList & list)

Creates new **CStringList** (p. 307) object from another **CStringList** (p. 307)

Parameters

<i>std::list</i>	[in] : std::list to be copied
------------------	-------------------------------

6.2.4.7 bool brathl::CObList::Erase (CBratObject * ob)

Delete an element referenced by ob

Returns

true if no error, otherwise false

6.2.4.8 bool brathl::CObList::Erase (CObList::iterator it) [virtual]

Delete an element referenced by it

Returns

true if no error, otherwise false

6.2.4.9 bool brathl::CDoublePtrArray::Erase (CDoublePtrArray::iterator it) [virtual]

Delete an element referenced by it

Returns

true if no error, otherwise false

Referenced by brathl::CDoublePtrArray::Erase().

6.2.4.10 bool brathl::CDoublePtrArray::Erase (int32_t index) [virtual]

Delete an element referenced by index

Returns

true if no error, otherwise false

References brathl::CDoublePtrArray::Erase().

6.2.4.11 `bool brathl::CArrayStringMap::Erase (CArrayStringMap::iterator it)` [virtual]

Delete an element referenced by it

Returns

true if no error, otherwise false

6.2.4.12 `bool brathl::CArrayStringMap::Erase (const std::string & key)` [virtual]

Delete an element by its key

Returns

true if no error, otherwise false

6.2.4.13 `bool brathl::CObArray::Erase (CBratObject * ob)`

Delete an element referenced by ob

Returns

true if no error, otherwise false

Referenced by brathl::CObArray::Erase().

6.2.4.14 `bool brathl::CObArray::Erase (CObArray::iterator it)` [virtual]

Delete an element referenced by it

Returns

true if no error, otherwise false

6.2.4.15 `bool brathl::CObArray::Erase (int32_t index)` [virtual]

Delete an element referenced by index

Returns

true if no error, otherwise false

References brathl::CObArray::Erase().

6.2.4.16 `bool brathl::CStringMap::Erase (CStringMap::iterator it)` [virtual]

Delete an element referenced by it

Returns

true if no error, otherwise false

Referenced by brathl::CStringMap::Erase().

6.2.4.17 `bool brathl::CStringMap::Erase (const std::string & key)` [virtual]

Delete an element by its key

Returns

true if no error, otherwise false

References brathl::CStringMap::Erase().

6.2.4.18 `bool brathl::CIntMap::Erase (CIntMap::iterator it)` [virtual]

Delete an element referenced by it

Returns

true if no error, otherwise false

Referenced by `brathl::CIntMap::Erase()`.

6.2.4.19 `bool brathl::CIntMap::Erase (const std::string & key)` [virtual]

Delete an element by its key

Returns

true if no error, otherwise false

References `brathl::CIntMap::Erase()`.

6.2.4.20 `bool brathl::CUIntMap::Erase (CUIntMap::iterator it)` [virtual]

Delete an element referenced by it

Returns

true if no error, otherwise false

Referenced by `brathl::CUIntMap::Erase()`.

6.2.4.21 `bool brathl::CUIntMap::Erase (const std::string & key)` [virtual]

Delete an element by its key

Returns

true if no error, otherwise false

References `brathl::CUIntMap::Erase()`.

6.2.4.22 `bool brathl::CDoubleMap::Erase (CDoubleMap::iterator it)` [virtual]

Delete an element referenced by it

Returns

true if no error, otherwise false

Referenced by `brathl::CDoubleMap::Erase()`.

6.2.4.23 `bool brathl::CDoubleMap::Erase (const std::string & key)` [virtual]

Delete an element by its key

Returns

true if no error, otherwise false

References `brathl::CDoubleMap::Erase()`.

6.2.4.24 `bool brathl::CObMap::Erase (CObMap::iterator it) [virtual]`

Delete an element referenced by it

Returns

true if no error, otherwise false

Referenced by `brathl::CObMap::Erase()`, and `brathl::CDataSet::EraseFieldSet()`.

6.2.4.25 `bool brathl::CObMap::Erase (const std::string & key) [virtual]`

Delete an element by its key

Returns

true if no error, otherwise false

References `brathl::CObMap::Erase()`.

6.2.4.26 `bool brathl::CObIntMap::Erase (CObIntMap::iterator it) [virtual]`

Delete an element referenced by it

Returns

true if no error, otherwise false

Referenced by `brathl::CObIntMap::Erase()`.

6.2.4.27 `bool brathl::CObIntMap::Erase (int32_t key) [virtual]`

Delete an element by its key

Returns

true if no error, otherwise false

References `brathl::CObIntMap::Erase()`.

6.2.4.28 `bool brathl::CObDoubleMap::Erase (CObDoubleMap::iterator it) [virtual]`

Delete an element referenced by it

Returns

true if no error, otherwise false

Referenced by `brathl::CObDoubleMap::Erase()`.

6.2.4.29 `bool brathl::CObDoubleMap::Erase (double key) [virtual]`

Delete an element by its key

Returns

true if no error, otherwise false

References `brathl::CObDoubleMap::Erase()`.

6.2.4.30 `bool brathl::CDoublePtrDoubleMap::Erase (CDoublePtrDoubleMap::iterator it) [virtual]`

Delete an element referenced by it

Returns

true if no error, otherwise false

Referenced by `brathl::CDoublePtrDoubleMap::Erase()`.

6.2.4.31 `bool brathl::CDoublePtrDoubleMap::Erase (double key) [virtual]`

Delete an element by its key

Returns

true if no error, otherwise false

References `brathl::CDoublePtrDoubleMap::Erase()`.

6.2.4.32 `bool brathl::CPtrMap::Erase (CPtrMap::iterator it) [virtual]`

Delete an element referenced by it

Returns

true if no error, otherwise false

Referenced by `brathl::CPtrMap::Erase()`.

6.2.4.33 `bool brathl::CPtrMap::Erase (const std::string & key) [virtual]`

Delete an element by its key

Returns

true if no error, otherwise false

References `brathl::CPtrMap::Erase()`.

6.2.4.34 `const CStringArray * brathl::CStringMap::Exists (const std::string & key) const [virtual]`

Tests if an element identify by 'key' already exists

Returns

a `std::string` array value corresponding to the key; if exists, otherwise empty `std::string`

6.2.4.35 `std::string brathl::CStringMap::Exists (const std::string & key) const [virtual]`

Tests if an element identify by 'key' already exists

Returns

a `std::string` value corresponding to the key; if exists, otherwise empty `std::string`

6.2.4.36 `int32_t brathl::CIntMap::Exists (const std::string & key) const [virtual]`

Tests if an element identify by 'key' already exists

Returns

a integer value corresponding to the key; if exists, otherwise default value **CTools::m_defaultValueINT32** (p.312)

References bratl::CTools::m_defaultValueINT32.

Referenced by bratl::CIntMap::operator[]().

6.2.4.37 `uint32_t bratl::CUIntMap::Exists (const std::string & key) const` [virtual]

Tests if an element identify by 'key' already exists

Returns

a integer value corresponding to the key; if exists, otherwise default value **CTools::m_defaultValueUINT32** (p.312)

References bratl::CTools::m_defaultValueUINT32.

Referenced by bratl::CUIntMap::operator[]().

6.2.4.38 `double bratl::CDoubleMap::Exists (const std::string & key) const` [virtual]

Tests if an element identify by 'key' already exists

Returns

a double value corresponding to the key; if exists, otherwise default value **CTools::m_defaultValueDOUBLE** (p.312)

References bratl::CTools::m_defaultValueDOUBLE.

Referenced by bratl::CDoubleMap::operator[]().

6.2.4.39 `CBratObject * bratl::COBMap::Exists (const std::string & key) const` [virtual]

Tests if an element identify by 'key' already exists

Returns

a CBratObject pointer if exists, otherwise NULL

6.2.4.40 `CBratObject * bratl::COBIntMap::Exists (int32_t key) const` [virtual]

Tests if an element identify by 'key' already exists

Returns

a CBratObject pointer if exists, otherwise NULL

6.2.4.41 `CBratObject * bratl::COBDoubleMap::Exists (double key) const` [virtual]

Tests if an element identify by 'key' already exists

Returns

a CBratObject pointer if exists, otherwise NULL

6.2.4.42 `DoublePtr * bratl::CDoublePtrDoubleMap::Exists (double key) const` [virtual]

Tests if an element identify by 'key' already exists

Returns

a CBratObject pointer if exists, otherwise NULL

6.2.4.43 `void * bratl::CPtrMap::Exists (const std::string & key) const` [virtual]

Tests if an element identify by 'key' already exists

Returns

a pointer if exists, otherwise NULL

6.2.4.44 `void bratl::CStringMap::GetKeys (CStringArray & keys, bool bRemoveAll=true) const` [virtual]

Gets keys of the std::map

Parameters

<i>keys</i>	[out] : the keys of the std::map
<i>bRemoveAll</i>	[in] : if true, remove keys array element before filling the keys

6.2.4.45 `void bratl::CUIntMap::GetKeys (CStringArray & keys, bool bRemoveAll=true)` [virtual]

Gets keys of the std::map

Parameters

<i>keys</i>	[out] : the keys of the std::map
<i>bRemoveAll</i>	[in] : if true, remove keys array element before filling the keys

6.2.4.46 `void bratl::CObMap::GetKeys (CStringArray & keys, bool bRemoveAll=true, bool bUnique=false)`
[virtual]

Gets keys of the std::map

Parameters

<i>keys</i>	[out] : the keys of the std::map
<i>bRemoveAll</i>	[in] : if true, remove keys array element before filling the keys

6.2.4.47 `void bratl::CObMap::GetKeys (CStringList & keys, bool bRemoveAll=true, bool bUnique=false)`
[virtual]

Gets keys of the std::map

Parameters

<i>keys</i>	[out] : the keys of the std::map
<i>bRemoveAll</i>	[in] : if true, remove keys array element before filling the keys

6.2.4.48 `void bratl::COblntMap::GetKeys (CIntArray & keys, bool bRemoveAll=true)` [virtual]

Gets keys of the std::map

Parameters

<i>keys</i>	[out] : the keys of the std::map
<i>bRemoveAll</i>	[in] : if true, remove keys array element before filling the keys

6.2.4.49 void bratl::CObDoubleMap::GetKeys (CDoubleArray & *keys*, bool *bRemoveAll* = true) [virtual]

Gets keys of the std::map

Parameters

<i>keys</i>	[out] : the keys of the std::map
<i>bRemoveAll</i>	[in] : if true, remove keys array element before filling the keys

6.2.4.50 void bratl::CDoublePtrDoubleMap::GetKeys (CDoubleArray & *keys*, bool *bRemoveAll* = true) [virtual]

Gets keys of the std::map

Parameters

<i>keys</i>	[out] : the keys of the std::map
<i>bRemoveAll</i>	[in] : if true, remove keys array element before filling the keys

6.2.4.51 CStringArray * bratl::CArrayStringMap::Insert (const std::string & *key*, const CStringArray & *str*, bool *withExcept* = true) [virtual]

Inserts a std::string

Parameters

<i>key</i>	: std::map key
<i>str</i>	: std::string value

Returns

the inserted std::string value or existing std::string value if key exists

6.2.4.52 std::string bratl::CStringMap::Insert (const std::string & *key*, const std::string & *str*, bool *withExcept* = true) [virtual]

Inserts a std::string

Parameters

<i>key</i>	: std::map key
<i>str</i>	: std::string value

Returns

the inserted std::string value or existing std::string value if key exists

Referenced by bratl::CStringMap::Insert().

6.2.4.53 void bratl::CStringMap::Insert (const CStringMap & *strmap*, bool *withExcept* = true) [virtual]

Inserts a std::string std::map

Parameters

<i>strmap</i>	: std::map to insert
<i>withExcept</i>	: true for exception handling, flse otherwise

Returns

the inserted std::string value or existing std::string value if key exists

References brathl::CStringMap::Insert().

6.2.4.54 `int32_t brathl::CIntMap::Insert (const std::string & key, int32_t value, bool withExcept = true) [virtual]`

Inserts an integer

Parameters

<i>key</i>	: std::map key
<i>value</i>	: int value

Returns

the inserted integer value or existing integer value if key exists

Referenced by brathl::CIntMap::Insert().

6.2.4.55 `void brathl::CIntMap::Insert (const CIntMap & m, bool bRemoveAll = true, bool withExcept = true) [virtual]`

Inserts a **CIntMap** (p. 251)

Parameters

<i>std::map</i>	[in]: std::map
<i>bRemoveAll</i>	[in] : if true, remove keys array element before filling the keys

References brathl::CIntMap::Insert(), and brathl::CIntMap::RemoveAll().

6.2.4.56 `uint32_t brathl::CUIntMap::Insert (const std::string & key, uint32_t value, bool withExcept = true) [virtual]`

Inserts an integer

Parameters

<i>key</i>	: std::map key
<i>value</i>	: int value

Returns

the inserted integer value or existing unsigned integer value if key exists

Referenced by brathl::CUIntMap::Insert().

6.2.4.57 `void brathl::CUIntMap::Insert (const CUIntMap & m, bool bRemoveAll = true, bool withExcept = true) [virtual]`

Inserts a **CUIntMap** (p. 334)

Parameters

<i>std::map</i>	[in]: std::map
<i>bRemoveAll</i>	[in] : if true, remove keys array element before filling the keys

References `bratl::CUIntMap::Insert()`, and `bratl::CUIntMap::RemoveAll()`.

6.2.4.58 `void bratl::CUIntMap::Insert (const CStringArray & keys, uint32_t initValue, bool bRemoveAll = true, bool withExcept = true) [virtual]`

Inserts a `CStrinArray` as keys and initial value

Parameters

<i>keys</i>	[in]: std::map keys to insert
<i>initValue</i>	[in]: value of the keys
<i>bRemoveAll</i>	[in] : if true, remove keys array element before filling the keys

References `bratl::CUIntMap::Insert()`, and `bratl::CUIntMap::RemoveAll()`.

6.2.4.59 `void bratl::CUIntMap::Insert (const CStringArray & keys, const CUIntArray & values, bool bRemoveAll = true, bool withExcept = true) [virtual]`

Inserts a `CStrinArray` as keys and a `CUIntArray` as value

Parameters

<i>keys</i>	[in]: keys to insert
<i>values</i>	[in]: values to insert
<i>bRemoveAll</i>	[in] : if true, remove keys array element before filling the keys

References `bratl::CTools::Format()`, `bratl::CUIntMap::Insert()`, and `bratl::CUIntMap::RemoveAll()`.

6.2.4.60 `double bratl::CDoubleMap::Insert (const std::string & key, double value, bool withExcept = true) [virtual]`

Inserts an double

Parameters

<i>key</i>	: std::map key
<i>value</i>	: double value

Returns

the inserted double value or existing double value if key exists

6.2.4.61 `CBratObject * bratl::CObMap::Insert (const std::string & key, CBratObject * ob, bool withExcept = true) [virtual]`

Inserts a `CBratObject` object

Parameters

<i>key</i>	: CBratObject name (std::map key)
<i>value</i>	: CBratObject value
<i>withExcept</i>	: true for exception handling, flse otherwise

Returns

CBratObject object or NULL if error

Referenced by brathl::CObMap::Insert(), brathl::CDataSet::InsertFieldSet(), and brathl::CObMap::RenameKey().

6.2.4.62 `void brathl::CObMap::Insert (const CObMap & obMap, bool withExcept = true) [virtual]`

Inserts a **CObMap** (p. 261)

Parameters

<i>obMap</i>	: CObMap (p. 261) to insert
<i>withExcept</i>	: true for exception handling, flse otherwise

References brathl::CObMap::Insert().

6.2.4.63 `CBratObject * brathl::CObIntMap::Insert (int32_t key, CBratObject * ob, bool withExcept = true) [virtual]`

Inserts a CBratObject object

Parameters

<i>key</i>	: CBratObject name (std::map key)
<i>value</i>	: CBratObject value
<i>withExcept</i>	: true for exception handling, flse otherwise

Returns

CBratObject object or NULL if error

Referenced by brathl::CObIntMap::Insert(), and brathl::CObIntMap::RenameKey().

6.2.4.64 `void brathl::CObIntMap::Insert (const CObIntMap & obMap, bool withExcept = true) [virtual]`

Inserts a **CObIntMap** (p. 258)

Parameters

<i>obMap</i>	: CObMap (p. 261) to insert
<i>withExcept</i>	: true for exception handling, flse otherwise

References brathl::CObIntMap::Insert().

6.2.4.65 `CBratObject * brathl::CObDoubleMap::Insert (double key, CBratObject * ob, bool withExcept = true) [virtual]`

Inserts a CBratObject object

Parameters

<i>key</i>	: CBratObject name (std::map key)
<i>value</i>	: CBratObject value
<i>withExcept</i>	: true for exception handling, flse otherwise

Returns

CBratObject object or NULL if error

Referenced by brathl::CObDoubleMap::Insert(), and brathl::CObDoubleMap::RenameKey().

6.2.4.66 `void brathl::CObDoubleMap::Insert (const CObDoubleMap & obMap, bool withExcept = true) [virtual]`

Inserts a **CObDoubleMap** (p. 258)

Parameters

<i>obMap</i>	: CObMap (p. 261) to insert
<i>withExcept</i>	: true for exception handling, flse otherwise

References `brathl::CObDoubleMap::Insert()`.

6.2.4.67 `DoublePtr * brathl::CDoublePtrDoubleMap::Insert (double key, DoublePtr * ob, bool withExcept = true) [virtual]`

Inserts a `DoublePtr*` object

Parameters

<i>key</i>	: <code>DoublePtr*</code> name (std::map key)
<i>value</i>	: <code>DoublePtr*</code> value
<i>withExcept</i>	: true for exception handling, flse otherwise

Returns

`DoublePtr*` object or NULL if error

Referenced by `brathl::CDoublePtrDoubleMap::RenameKey()`.

6.2.4.68 `void * brathl::CPtrMap::Insert (const std::string & key, void * ptr, bool withExcept = true) [virtual]`

Inserts a pointer

Parameters

<i>key</i>	: keymap
<i>value</i>	: pointer value
<i>withExcept</i>	: true for exception handling, flse otherwise

Returns

pointer or NULL if error

Referenced by `brathl::CPtrMap::Insert()`.

6.2.4.69 `void brathl::CPtrMap::Insert (const CPtrMap & ptrMap, bool withExcept = true) [virtual]`

Inserts a **CPtrMap** (p. 303)

Parameters

<i>obMap</i>	: CPtrMap (p. 303) to insert
<i>withExcept</i>	: true for exception handling, flse otherwise

References `brathl::CPtrMap::Insert()`.

6.2.4.70 `std::string brathl::CStringMap::IsValue (const std::string & value) [virtual]`

Tests if an element value exists

Returns

a std::string key corresponding to the value (or the first key found, if some values are the same); if exists, otherwise empty std::string

6.2.4.71 `const CStringList & brathl::CStringList::operator= (const CStringList & lst)` [virtual]

Copy a new **CStringList** (p. 307) to the object

6.2.4.72 `const CIntList & brathl::CIntList::operator= (const CIntList & lst)`

Copy a new **CIntList** (p. 251) to the object

6.2.4.73 `const CObList & brathl::CObList::operator= (const CObList & lst)` [virtual]

Copy a new **CStringList** (p. 307) to the object

References brathl::CObList::RemoveAll().

6.2.4.74 `const CObArray & brathl::CObArray::operator= (const CObArray & lst)` [virtual]

Copy a new **CObArray** (p. 257) to the object

References brathl::CObArray::RemoveAll().

6.2.4.75 `int32_t brathl::CIntMap::operator[] (const std::string & key)` [virtual]

operator[] redefinition. Searches an integer value identifiy by 'key'.

Parameters

<i>key</i>	: std::string keyword
------------	-----------------------

Returns

the interger value if found, default value **CTools::m_defaultValueINT32** (p. 312) if not found

References brathl::CIntMap::Exists().

6.2.4.76 `uint32_t brathl::CUIntMap::operator[] (const std::string & key)` [virtual]

operator[] redefinition. Searches an integer value identifiy by 'key'.

Parameters

<i>key</i>	: std::string keyword
------------	-----------------------

Returns

the interger value if found, default value **CTools::m_defaultValueUINT32** (p. 312) if not found

References brathl::CUIntMap::Exists().

6.2.4.77 `double brathl::CDoubleMap::operator[] (const std::string & key)` [virtual]

operator[] redefinition. Searches an integer value identifiy by 'key'.

Parameters

<i>key</i>	: std::string keyword
------------	-----------------------

Returns

the double value if found, default value **CTools::m_defaultValueDOUBLE** (p. 312) if not found

References bratl::CDoubleMap::Exists().

6.2.4.78 CBratObject * bratl::CObMap::operator[] (const std::string & key) [virtual]

operator[] redefinition. Searches a CBratObject object identify by 'key'. DON'T USE this syntax if you are not sure the key exists, there's a bug in STL, after calling 'record = m_recordSetMap[recordSetName]', if key not existed and the std::map is empty then the key exists in the std::map and points to a NULL object CBratObject *o = myMap[key] → use Exists method instead ;

Parameters

<i>key</i>	: CBratObject keyword
------------	-----------------------

Returns

a pointer to the CBratObject object if found, NULL if not found

6.2.4.79 CBratObject * bratl::COblntMap::operator[] (int32_t key) [virtual]

operator[] redefinition. Searches a CBratObject object identify by 'key'. DON'T USE this syntax if you are not sure the key exists, there's a bug in STL, after calling 'record = m_recordSetMap[recordSetName]', if key not existed and the std::map is empty then the key exists in the std::map and points to a NULL object CBratObject *o = myMap[key] → use Exists method instead ;

Parameters

<i>key</i>	: CBratObject keyword
------------	-----------------------

Returns

a pointer to the CBratObject object if found, NULL if not found

6.2.4.80 CBratObject * bratl::CObDoubleMap::operator[] (double key) [virtual]

operator[] redefinition. Searches a CBratObject object identify by 'key'. DON'T USE this syntax if you are not sure the key exists, there's a bug in STL, after calling 'record = m_recordSetMap[recordSetName]', if key not existed and the std::map is empty then the key exists in the std::map and points to a NULL object CBratObject *o = myMap[key] → use Exists method instead ;

Parameters

<i>key</i>	: CBratObject keyword
------------	-----------------------

Returns

a pointer to the CBratObject object if found, NULL if not found

6.2.4.81 DoublePtr * bratl::CDoublePtrDoubleMap::operator[] (double key) [virtual]

operator[] redefinition. Searches a CBratObject object identify by 'key'. DON'T USE this syntax if you are not sure the key exists, there's a bug in STL, after calling 'record = m_recordSetMap[recordSetName]', if key not existed and the std::map is empty then the key exists in the std::map and points to a NULL object CBratObject *o = myMap[key] → use Exists method instead ;

Parameters

<i>key</i>	: CBratObject keyword
------------	-----------------------

Returns

a pointer to the CBratObject object if found, NULL if not found

6.2.4.82 void * brathl::CPtrMap::operator[] (const std::string & key) [virtual]

operator[] redefinition. Searches a CBratObject object identify by 'key'. DON'T USE this syntax if you are not sure the key exists, there's a bug in STL, after calling 'record = m_recordSetMap[recordSetName]', if key not existed and the std::map is empty then the key exists in the std::map and points to a NULL object void *p = myMap[key] -> use Exists method instead ;

Parameters

<i>key</i>	: CBratObject keyword
------------	-----------------------

Returns

a pointer to the pointer if found, NULL if not found

6.2.4.83 void brathl::CObList::RemoveAll () [virtual]

Remove all elements and clear the std::list

Reimplemented in **brathl::CField::CListField** (p. 253).

Referenced by brathl::CObList::operator=(), brathl::CField::CListField::RemoveAll(), and brathl::CObList::~CObList().

6.2.4.84 void brathl::CDoublePtrArray::RemoveAll () [virtual]

Remove all elements and clear the std::list

Referenced by brathl::CDoublePtrArray::~CDoublePtrArray().

6.2.4.85 void brathl::CArrayDoublePtrArray::RemoveAll () [virtual]

Remove all elements and clear the std::list

6.2.4.86 void brathl::CArrayDoubleArray::RemoveAll () [virtual]

Remove all elements and clear the std::list

6.2.4.87 void brathl::CArrayStringMap::RemoveAll () [virtual]

Remove all elements and clear the std::map

6.2.4.88 void brathl::CObStack::RemoveAll () [virtual]

Remove all elements and clear the std::list

References brathl::CObStack::m_bDelete.

Referenced by brathl::CObStack::~CObStack().

6.2.4.89 void brathl::CObArray::RemoveAll () [virtual]

Remove all elements and clear the std::list

Reimplemented in **brathl::CDataSet** (p. 176).

Referenced by `brathl::CObArray::operator=()`, and `brathl::CObArray::~~CObArray()`.

6.2.4.90 `void brathl::CStringMap::RemoveAll () [virtual]`

Remove all elements and clear the `std::map`

Referenced by `brathl::CStringMap::~~CStringMap()`.

6.2.4.91 `void brathl::CIntMap::RemoveAll () [virtual]`

Remove all elements and clear the `std::map`

Referenced by `brathl::CIntMap::Insert()`, and `brathl::CIntMap::~~CIntMap()`.

6.2.4.92 `void brathl::CUIntMap::RemoveAll () [virtual]`

Remove all elements and clear the `std::map`

Referenced by `brathl::CUIntMap::Insert()`, and `brathl::CUIntMap::~~CUIntMap()`.

6.2.4.93 `void brathl::CDoubleMap::RemoveAll () [virtual]`

Remove all elements and clear the `std::map`

Referenced by `brathl::CDoubleMap::~~CDoubleMap()`.

6.2.4.94 `void brathl::CObMap::RemoveAll () [virtual]`

Remove all elements and clear the `std::map`

Referenced by `brathl::CDataSet::RemoveAll()`, and `brathl::CObMap::~~CObMap()`.

6.2.4.95 `void brathl::CObIntMap::RemoveAll () [virtual]`

Remove all elements and clear the `std::map`

Referenced by `brathl::CObIntMap::~~CObIntMap()`.

6.2.4.96 `void brathl::CObDoubleMap::RemoveAll () [virtual]`

Remove all elements and clear the `std::map`

Referenced by `brathl::CObDoubleMap::~~CObDoubleMap()`.

6.2.4.97 `void brathl::CDoublePtrDoubleMap::RemoveAll () [virtual]`

Remove all elements and clear the `std::map`

Referenced by `brathl::CDoublePtrDoubleMap::~~CDoublePtrDoubleMap()`.

6.2.4.98 `void brathl::CPtrMap::RemoveAll () [virtual]`

Remove all elements and clear the `std::map`

Referenced by `brathl::CPtrMap::~~CPtrMap()`.

6.2.4.99 `bool brathl::CObMap::RenameKey (const std::string & oldKey, const std::string & newKey)`

Rename a key

Parameters

<i>oldKey</i>	: old key
<i>newKey</i>	: new key

Returns

true if key is renamed, otherwise false

References bratl::COBMap::Insert().

6.2.4.100 bool bratl::COBIntMap::RenameKey (int32_t *oldKey*, int32_t *newKey*)

Rename a key

Parameters

<i>oldKey</i>	: old key
<i>newKey</i>	: new key

Returns

true if key is renamed, otherwise false

References bratl::COBIntMap::Insert().

6.2.4.101 bool bratl::COBDoubleMap::RenameKey (double *oldKey*, double *newKey*)

Rename a key

Parameters

<i>oldKey</i>	: old key
<i>newKey</i>	: new key

Returns

true if key is renamed, otherwise false

References bratl::COBDoubleMap::Insert().

6.2.4.102 bool bratl::CDBPtrDoubleMap::RenameKey (double *oldKey*, double *newKey*)

Rename a key

Parameters

<i>oldKey</i>	: old key
<i>newKey</i>	: new key

Returns

true if key is renamed, otherwise false

References bratl::CDBPtrDoubleMap::Insert().

6.2.4.103 void bratl::CArrayStringMap::Set (const CArrayStringMap & *a*) [virtual]

Inserts a std::string std::map

Parameters

<i>strmap</i>	: std::map to insert
<i>withExcept</i>	: true for exception handling, flse otherwise

Returns

the inserted std::string value or existing std::string value if key exists

6.3.1 Detailed Description

6.3.2 Function Documentation

6.3.2.1 **bratl::CCriteriaPassInt::CCriteriaPassInt (int32_t from, int32_t to)**

Constructor.

Parameters

<i>from</i>	start pass
<i>to</i>	end pass

6.3.2.2 **bratl::CCriteriaPassInt::CCriteriaPassInt (const std::string & from, const std::string & to)**

Constructor.

Parameters

<i>from</i>	start pass
<i>to</i>	end pass

6.3.2.3 **bratl::CCriteriaPassInt::CCriteriaPassInt (const CStringArray & array)**

Constructor from a array that contains start pass as std::string, end pass as std::string

Parameters

<i>array</i>	start and end dates
--------------	---------------------

6.3.2.4 `bratl::CCriteriaPassString::CCriteriaPassString (const std::string & passes, const std::string & delimiter = CCriteriaPassString::m_delimiter)`

Constructor from a std::string that contains passes delimited by a comma)

Parameters

<i>passes</i>	passes to set
---------------	---------------

6.3.2.5 `bratl::CCriteriaPassString::CCriteriaPassString (const CStringArray & array)`

Constructor from a array that contains passes

Parameters

<i>array</i>	start and end dates
--------------	---------------------

6.3.2.6 `bratl::CProduct::CProduct (const std::string & fileName)` [protected]

Creates new CProduct object

Parameters

<i>fileName</i>	[in] : file name to be connected
-----------------	----------------------------------

6.3.2.7 `bratl::CProduct::CProduct (const CStringList & fileNameList, bool check_only_first_file)` [protected]

Creates new CProduct object

Parameters

<i>fileNameList</i>	[in] : list of file to be connected
---------------------	-------------------------------------

6.3.2.8 `bratl::CProductGeneric::CProductGeneric (const std::string & fileName)` [inline]

Creates new CProdCProductGenericuct object

Parameters

<i>fileName</i>	[in] : file name to be connected
-----------------	----------------------------------

6.3.2.9 `bratl::CProductGeneric::CProductGeneric (const CStringList & fileNameList, bool check_only_first_file)`
[inline]

Creates new CProductGeneric object

Parameters

<i>fileNameList</i>	[in] : list of file to be connected
---------------------	-------------------------------------

6.3.2.10 `bratl::CProductList::CProductList (const CProductList & o)` [inline]

Creates new **CProductList** (p. 284) object from another one

Parameters

<i>o</i>	[in] : productList object to be copied
----------	--

6.3.2.11 brathl::CProductList::CProductList (const std::string & *fileName*)

Creates new **CProductList** (p. 284) object

Parameters

<i>fileName</i>	[in] : file name to be connected
-----------------	----------------------------------

6.3.2.12 brathl::CProductList::CProductList (const CStringList & *fileNameList*)

Creates new CProduct object

Parameters

<i>fileNameList</i>	[in] : list of file to be connected
---------------------	-------------------------------------

6.3.2.13 brathl::CProductList::CProductList (const CStringArray & *fileNameArray*)

Creates new CProduct object

Parameters

<i>fileNameArray</i>	[in] : array of file to be connected
----------------------	--------------------------------------

6.3.2.14 bool brathl::CCriteriaPassString::Intersect (const std::string & *passes*, CStringArray & *intersect*)

Creates the intersection of these passes with the given one

Parameters

<i>passes</i>	intersect with this
<i>intersect</i>	intersection passes

Returns

true, or false if there is no intersection

6.3.2.15 bool brathl::CCriteriaPassString::Intersect (CStringArray & *passes*, CStringArray & *intersect*)

Creates the intersection of these passes with the given one

Parameters

<i>passes</i>	intersect with this
<i>intersect</i>	intersection passes

Returns

true, or false if there is no intersection

6.3.2.16 bool brathl::CCriteriaPassInt::Intersect (CStringArray & *array*, CStringArray & *intersect*)

Create the intersection of this date period with the given one

Parameters

<i>array</i>	that contains start pass as std::string, end pass as std::string
<i>intersect</i>	intersection period

Returns

true, or false if there is no intersection

6.3.2.17 `bool brathl::CCriteriaPassInt::Intersect (CStringArray & array, CIntArray & intersect)`

Create the intersection of this date period with the given one

Parameters

<i>array</i>	that contains start pass as std::string, end pass as std::string
<i>intersect</i>	intersection period

Returns

true, or false if there is no intersection

6.3.2.18 `bool brathl::CCriteriaPassInt::Intersect (CIntArray & array, CStringArray & intersect)`

Create the intersection of this date period with the given one

Parameters

<i>array</i>	that contains start pass as std::string, end pass as std::string
<i>intersect</i>	intersection period

Returns

true, or false if there is no intersection

6.3.2.19 `bool brathl::CCriteriaPassInt::Intersect (CIntArray & array, CIntArray & intersect)`

Create the intersection of this date period with the given one

Parameters

<i>array</i>	that contains start pass as std::string, end pass as std::string
<i>intersect</i>	intersection period

Returns

true, or false if there is no intersection

6.3.2.20 `virtual bool brathl::CCriteriaPass::IsDefaultValue () [pure virtual]`

Tests whether date period have been initialized or not

Returns

true if not initialized

Implements **brathl::CCriteria** (p. 141).

Implemented in **brathl::CCriteriaPassInt** (p. 61), and **brathl::CCriteriaPassString** (p. 61).

6.3.2.21 `bool bratl::CCriteriaPassString::IsDefaultValue () [virtual]`

Tests whether passes have been initialized or not

Returns

true if not initialized

Implements **bratl::CCriteriaPass** (p. 60).

6.3.2.22 `bool bratl::CCriteriaPassInt::IsDefaultValue () [virtual]`

Tests whether the pass have been initialized or not

Returns

true if not initialized

Implements **bratl::CCriteriaPass** (p. 60).

6.3.2.23 `virtual bool bratl::CProduct::IsHighResolutionField (CField *) [inline],[virtual]`

Determines if a field object is a 'high resolution' array data see classes derived from CProduct.

6.3.2.24 `CProductList & bratl::CProductList::operator= (const CProductList & lst)`

Creates new CProductList object from another one

Parameters

<i>o</i>	[in] : productList object to be copied
----------	--

6.3.2.25 `void bratl::CCriteriaPassString::Set (const std::string & passes, const std::string & delimiter = CCriteriaPassString::m_delimiter)`

Sets one or more passes from a std::string (delimited by a comma)

Parameters

<i>passes</i>	passes to set
---------------	---------------

6.3.2.26 `void bratl::CCriteriaPassString::Set (const CStringArray & array)`

Sets passes from a array

Parameters

<i>array</i>	array of passes
--------------	-----------------

6.3.2.27 `void bratl::CCriteriaPassInt::Set (int32_t from, int32_t to)`

Sets date period from start and end pass

Parameters

<i>from</i>	start pass
<i>to</i>	end pass

6.3.2.28 void brathl::CCriteriaPassInt::Set (const std::string & *from*, const std::string & *to*)

Sets date period from start and end pass

Parameters

<i>from</i>	start pass
<i>to</i>	end pass

References brathl::CTools::StrToInt32().

6.3.2.29 void brathl::CCriteriaPassInt::Set (const CStringArray & *array*)

Sets a date period from a array that contains start pass as std::string, end pass as std::string

Parameters

<i>array</i>	start and end dates
--------------	---------------------

6.3.2.30 virtual void brathl::CCriteriaPass::SetDefaultValue () [pure virtual]

Sets internal value to the default value (uninitialized)

Implements **brathl::CCriteria** (p. 141).

Implemented in **brathl::CCriteriaPassInt** (p. 62), and **brathl::CCriteriaPassString** (p. 62).

6.3.2.31 void brathl::CCriteriaPassString::SetDefaultValue () [virtual]

Sets internal value to the default value (uninitialized)

Implements **brathl::CCriteriaPass** (p. 62).

6.3.2.32 void brathl::CCriteriaPassInt::SetDefaultValue () [virtual]

Sets internal value to the default value (uninitialized)

Implements **brathl::CCriteriaPass** (p. 62).

6.3.2.33 void brathl::CCriteriaPassInt::SetFrom (int32_t *from*)

Sets start pass

Parameters

<i>to</i>	start pass
-----------	------------

6.3.2.34 void brathl::CCriteriaPassInt::SetFrom (const std::string & *from*)

Sets start pass

Parameters

<i>to</i>	start pass
-----------	------------

References brathl::CTools::StrToInt32().

6.3.2.35 void brathl::CCriteriaPassInt::SetTo (int32_t *to*)

Sets end pass

Parameters

<i>to</i>	end pass
-----------	----------

6.3.2.36 void bratl::CCriteriaPassInt::SetTo (const std::string & *to*)

Sets end pass

Parameters

<i>to</i>	end pass
-----------	----------

References bratl::CTools::StrToInt32().

6.3.3 Variable Documentation

6.3.3.1 const long bratl::DEFAULT_DIM[] = {1}

Product management class.

Version

1.0

6.5.1 Detailed Description

6.6 Parameters

Classes

- class **brathl::CFileParams**
- class **brathl::CMapParameter**
- class **brathl::CParameter**

Functions

- **brathl::CMapParameter::CMapParameter ()**
CMapParameter (p. 255) ctor.
- virtual void **brathl::CMapParameter::Dump** (std::ostream &fOut=std::cerr)
Dump function.
- bool **brathl::CMapParameter::Erase** (CMapParameter::iterator iteratorParameter)
- bool **brathl::CMapParameter::Erase** (const std::string &key)
- **CParameter * brathl::CMapParameter::Exists** (const std::string &key)
- **CParameter * brathl::CMapParameter::Insert** (const std::string &key, const std::string &value)
- **CParameter * brathl::CMapParameter::operator[]** (const std::string key)
- void **brathl::CMapParameter::RemoveAll** ()
- virtual **brathl::CMapParameter::~~CMapParameter** ()
CMapParameter (p. 255) dtor.

6.6.1 Detailed Description

6.6.2 Function Documentation

6.6.2.1 bool brathl::CMapParameter::Erase (CMapParameter::iterator iteratorParameter)

Delete an element referenced by iteratorMnemo

Returns

true if no error, otherwise false

6.6.2.2 bool brathl::CMapParameter::Erase (const std::string & key)

Delete an element by its key

Returns

true if no error, otherwise false

6.6.2.3 CParameter * brathl::CMapParameter::Exists (const std::string & key)

Tests if an element identify by 'key' already exists

Returns

a **CParameter** (p. 262) pointer if exists, otherwise NULL

Referenced by brathl::CFileParams::CheckCount().

6.6.2.4 CParameter * brathl::CMapParameter::Insert (const std::string & key, const std::string & value)

Inserts a **CParameter** (p. 262) object

Parameters

<i>key</i>	: parameter name (std::map key)
<i>value</i>	: parameter value

Returns

CParameter (p. 262) object or NULL if error

References brathl::CParameter::AddValue().

6.6.2.5 CParameter * brathl::CMapParameter::operator[] (const std::string key)

operator[] redefinition. Searches a **CParameter** (p. 262) object identify by 'key'. DON'T USE this syntax if you are not sure the key exists, there's a bug in STL, after calling 'record = m_recordSetMap[recordSetName]', if key not existed and the std::map is empty then the key exists in the std::map and points to a NULL object **CParameter** (p. 262) *p = m_mapParam[key] -> use Exists method instead ;

Parameters

<i>key</i>	: parameter keyword
------------	---------------------

Returns

a pointer to th **CParameter** (p. 262) object if found, NULL if not found

6.6.2.6 void brathl::CMapParameter::RemoveAll ()

Remove all elements and clear the std::map

Referenced by brathl::CFileParams::Load().

6.7 Date conversion C APIs

Functions

- LIBRATHL_API int32_t **brathl_Cycle2YMDHMSM** (**brathl_mission** mission, int32_t cycle, int32_t pass, **brathl_DateYMDHMSM** *dateYMDHMSM)
- LIBRATHL_API int32_t **brathl_DayOfYear** (**brathl_DateYMDHMSM** *dateYMDHMSM, uint32_t *dayOfYear)
- LIBRATHL_API int32_t **brathl_DiffDSM** (**brathl_DateDSM** *dateDSM1, **brathl_DateDSM** *dateDSM2, double *diff)
- LIBRATHL_API int32_t **brathl_DiffJulian** (**brathl_DateJulian** *dateJulian1, **brathl_DateJulian** *dateJulian2, double *diff)
- LIBRATHL_API int32_t **brathl_DiffYMDHMSM** (**brathl_DateYMDHMSM** *dateYMDHMSM1, **brathl_DateYMDHMSM** *dateYMDHMSM2, double *diff)

- LIBRATHL_API int32_t **brathl_DSM2Seconds** (**brathl_DateDSM** *dateDSM, **brathl_refDate** refDate, **brathl_DateSecond** *dateSeconds)
- LIBRATHL_API int32_t **brathl_DSM2YMDHMSM** (**brathl_DateDSM** *dateDSM, **brathl_DateYMDHMSM** *dateYMDHMSM)
- LIBRATHL_API int32_t **brathl_Julian2DSM** (**brathl_DateJulian** *dateJulian, **brathl_refDate** refDate, **brathl_DateDSM** *dateDSM)
- LIBRATHL_API int32_t **brathl_Julian2Seconds** (**brathl_DateJulian** *dateJulian, **brathl_refDate** refDate, **brathl_DateSecond** *dateSeconds)
- LIBRATHL_API int32_t **brathl_Julian2YMDHMSM** (**brathl_DateJulian** *dateJulian, **brathl_DateYMDHMSM** *dateYMDHMSM)
- LIBRATHL_API int32_t **brathl_NowYMDHMSM** (**brathl_DateYMDHMSM** *dateYMDHMSM)
- LIBRATHL_API int32_t **brathl_Seconds2DSM** (**brathl_DateSecond** *dateSeconds, **brathl_refDate** refDate, **brathl_DateDSM** *dateDSM)
- LIBRATHL_API int32_t **brathl_Seconds2Julian** (**brathl_DateSecond** *dateSeconds, **brathl_refDate** refDate, **brathl_DateJulian** *dateJulian)
- LIBRATHL_API int32_t **brathl_Seconds2YMDHMSM** (**brathl_DateSecond** *dateSeconds, **brathl_DateYMDHMSM** *dateYMDHMSM)
- LIBRATHL_API int32_t **brathl_YMDHMSM2Cycle** (**brathl_mission** mission, **brathl_DateYMDHMSM** *dateYMDHMSM, int32_t *cycle, int32_t *pass)
- LIBRATHL_API int32_t **brathl_YMDHMSM2DSM** (**brathl_DateYMDHMSM** *dateYMDHMSM, **brathl_refDate** refDate, **brathl_DateDSM** *dateDSM)
- LIBRATHL_API int32_t **brathl_YMDHMSM2Julian** (**brathl_DateYMDHMSM** *dateYMDHMSM, **brathl_refDate** refDate, **brathl_DateJulian** *dateJulian)
- LIBRATHL_API int32_t **brathl_YMDHMSM2Seconds** (**brathl_DateYMDHMSM** *dateYMDHMSM, **brathl_refDate** refDate, **brathl_DateSecond** *dateSeconds)

6.7.1 Detailed Description

6.7.2 Function Documentation

6.7.2.1 LIBRATHL_API int32_t brathl_Cycle2YMDHMSM (brathl_mission mission, int32_t cycle, int32_t pass, brathl_DateYMDHMSM * dateYMDHMSM)

Converts a cyle/pass into a date

Parameters

in	<i>mission</i>	: mission type (see brathl_mission (p. 341))
in	<i>cycle</i>	: number of cycle to convert
in	<i>pass</i>	: number of pass in the cycle to convert
out	<i>dateYMDHMSM</i>	: date corresponding to the cycle/pass

Returns

#BRATHL_SUCCESS or error code (see Cycle_date_error_codes)

References brathl::CDate::Convert2YMDHMSM().

Referenced by FTN_NAME().

6.7.2.2 LIBRATHL_API int32_t brathl_DayOfYear (brathl_DateYMDHMSM * dateYMDHMSM, uint32_t * dayOfYear)

Retrieves the day of year of a date

Parameters

in	<i>dateYMDHMSM</i>	: date
out	<i>dayOfYear</i>	: day of year of the date parameter

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::DayOfYear(), and brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.7.2.3 LIBRATHL_API int32_t brathl_DiffDSM (brathl_DateDSM * dateDSM1, brathl_DateDSM * dateDSM2, double * diff)

Computes the difference between two dates (date1 - date2) the result is expressed in a decimal number of seconds

Parameters

in	<i>dateDSM1</i>	: date1
in	<i>dateDSM2</i>	: date2
out	<i>diff</i>	: difference in seconds (date1 - date2)

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.7.2.4 LIBRATHL_API int32_t brathl_DiffJulian (brathl_DateJulian * dateJulian1, brathl_DateJulian * dateJulian2, double * diff)

Computes the difference between two dates (date1 - date2) the result is expressed in a decimal number of seconds

Parameters

in	<i>dateJulian1</i>	: date1
in	<i>dateJulian2</i>	: date2
out	<i>diff</i>	: difference in seconds (date1 - date2)

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.7.2.5 `LIBRATHL_API int32_t brathl_DiffYMDHMSM (brathl_DateYMDHMSM * dateYMDHMSM1,
brathl_DateYMDHMSM * dateYMDHMSM2, double * diff)`

Computes the difference between two dates (date1 - date2) the result is expressed in a decimal number of seconds

Parameters

in	<i>dateYMDHMS-M1</i>	: date1
in	<i>dateYMDHMS-M2</i>	: date2
out	<i>diff</i>	: difference in seconds (date1 - date2)

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.7.2.6 `LIBRATHL_API int32_t brathl_DSM2Julian (brathl_DateDSM * dateDSM, brathl_refDate refDate,
brathl_DateJulian * dateJulian)`

Converts a days-seconds-microseconds date into a decimal julian date, according to refDate parameter

Parameters

in	<i>dateDSM</i>	: date to convert
in	<i>refDate</i>	: date reference conversion
out	<i>dateJulian</i>	: result of the conversion

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::Convert2DecimalJulian(), _structDateJulian::julian, _structDateJulian::refDate, and brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.7.2.7 `LIBRATHL_API int32_t brathl_DSM2Seconds (brathl_DateDSM * dateDSM, brathl_refDate refDate,
brathl_DateSecond * dateSeconds)`

Converts a date in days-seconds-microseconds into a seconds, according to refDate parameter

Parameters

in	<i>dateDSM</i>	: date to convert
in	<i>refDate</i>	: date reference conversion
out	<i>dateSeconds</i>	: result of the conversion

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::Convert2Second(), _structDateSecond::nbSeconds, _structDateSecond::refDate, and brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.7.2.8 `LIBRATHL_API int32_t brathl_DSM2YMDHMSM (brathl_DateDSM * dateDSM, brathl_DateYMDHMSM * dateYMDHMSM)`

Converts a days-seconds-microseconds date into a year, month, day, hour, minute, second, microsecond date

Parameters

in	<i>dateDSM</i>	: date to convert
out	<i>dateYMDHMSM</i>	: result of the conversion

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::Convert2YMDHMSM(), and brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.7.2.9 `LIBRATHL_API int32_t brathl_Julian2DSM (brathl_DateJulian * dateJulian, brathl_refDate refDate, brathl_DateDSM * dateDSM)`

Converts a decimal julian date into a days-seconds-microseconds date, according to refDate parameter

Parameters

in	<i>dateJulian</i>	: date to convert
in	<i>refDate</i>	: date reference conversion
out	<i>dateDSM</i>	: result of conversion

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::Convert2DSM(), _structDateDSM::days, _structDateDSM::muSeconds, _structDateDSM::refDate, _structDateDSM::seconds, and brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.7.2.10 `LIBRATHL_API int32_t brathl_Julian2Seconds (brathl_DateJulian * dateJulian, brathl_refDate refDate, brathl_DateSecond * dateSeconds)`

Converts a decimal julian date into seconds, according to refDate parameter

Parameters

in	<i>dateJulian</i>	: date to convert
in	<i>refDate</i>	: date reference conversion
out	<i>dateSeconds</i>	: result of the conversion

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::Convert2Second(), _structDateSecond::nbSeconds, _structDateSecond::refDate, and brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.7.2.11 LIBRATHL_API int32_t brathl_Julian2YMDHMSM (brathl_DateJulian * *dateJulian*, brathl_DateYMDHMSM * *dateYMDHMSM*)

Converts a decimal julian date into a year, month, day, hour, minute, second, microsecond date

Parameters

in	<i>dateJulian</i>	: date to convert
out	<i>dateYMDHMSM</i>	: result of the conversion

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::Convert2YMDHMSM(), and brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.7.2.12 LIBRATHL_API int32_t brathl_NowYMDHMSM (brathl_DateYMDHMSM * *dateYMDHMSM*)

Gets the current date/time,

Parameters

out	<i>dateYMDHMSM</i>	: current date/time
-----	--------------------	---------------------

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::Convert2YMDHMSM(), and brathl::CDate::SetDateNow().

Referenced by FTN_NAME().

6.7.2.13 LIBRATHL_API int32_t brathl_Seconds2DSM (brathl_DateSecond * *dateSeconds*, brathl_refDate *refDate*, brathl_DateDSM * *dateDSM*)

Converts seconds into a days-seconds-microseconds date, according to refDate parameter

Parameters

in	<i>dateSeconds</i>	: date to convert
in	<i>refDate</i>	: date reference conversion
out	<i>dateDSM</i>	: result of the conversion

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::Convert2DSM(), _structDateDSM::days, _structDateDSM::muSeconds, _structDateDSM::refDate, _structDateDSM::seconds, and brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.7.2.14 LIBRATHL_API int32_t brathl_Seconds2Julian (brathl_DateSecond * *dateSeconds*, brathl_refDate *refDate*, brathl_DateJulian * *dateJulian*)

Converts seconds into a decimal julian date, according to refDate parameter

Parameters

in	<i>dateSeconds</i>	: date to convert
in	<i>refDate</i>	: date reference conversion
out	<i>dateJulian</i>	: result of the conversion

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::Convert2DecimalJulian(), _structDateJulian::julian, _structDateJulian::refDate, and brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.7.2.15 LIBRATHL_API int32_t brathl_Seconds2YMDHMSM (brathl_DateSecond * *dateSeconds*, brathl_DateYMDHMSM * *dateYMDHMSM*)

Converts seconds into a year, month, day, hour, minute, second, microsecond date

Parameters

in	<i>dateSeconds</i>	: date to convert
out	<i>dateYMDHMSM</i>	: result of the conversion

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::Convert2YMDHMSM(), and brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.7.2.16 LIBRATHL_API int32_t brathl_YMDHMSM2Cycle (brathl_mission *mission*, brathl_DateYMDHMSM * *dateYMDHMSM*, int32_t * *cycle*, int32_t * *pass*)

Converts a date into a cycle/pass

Parameters

in	<i>mission</i>	: mission type (see brathl_mission (p. 341))
in	<i>dateYMDHMSM</i>	: date to convert
out	<i>cycle</i>	: number of cycle
out	<i>pass</i>	: number of pass in the cycle

Returns

#BRATHL_SUCCESS or error code (see Cycle_date_error_codes)

References brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.7.2.17 LIBRATHL_API int32_t brathl_YMDHMSM2DSM (brathl_DateYMDHMSM * dateYMDHMSM, brathl_refDate refDate, brathl_DateDSM * dateDSM)

Converts a year, month, day, hour, minute, second, microsecond date into a days-seconds-microseconds date, according to refDate parameter

Parameters

in	<i>dateYMDHMSM</i>	: date to convert
in	<i>refDate</i>	: date reference conversion
out	<i>dateDSM</i>	: result of the conversion

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::Convert2DSM(), _structDateDSM::days, _structDateDSM::muSeconds, _structDateDSM::refDate, _structDateDSM::seconds, and brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.7.2.18 LIBRATHL_API int32_t brathl_YMDHMSM2Julian (brathl_DateYMDHMSM * dateYMDHMSM, brathl_refDate refDate, brathl_DateJulian * dateJulian)

Converts a year, month, day, hour, minute, second, microsecond date into a decimal julian date, according to refDate parameter

Parameters

in	<i>dateYMDHMSM</i>	: date to convert
in	<i>refDate</i>	: date reference conversion
out	<i>dateJulian</i>	: result of the conversion

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::Convert2DecimalJulian(), _structDateJulian::julian, _structDateJulian::refDate, and brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.7.2.19 LIBRATHL_API int32_t brathl_YMDHMSM2Seconds (brathl_DateYMDHMSM * dateYMDHMSM, brathl_refDate refDate, brathl_DateSecond * dateSeconds)

Converts a year, month, day, hour, minute, second, microsecond date into seconds, according to refDate parameter

Parameters

in	<i>dateYMDHMSM</i>	: date to convert
in	<i>refDate</i>	: date reference conversion
out	<i>dateSeconds</i>	: result of the conversion

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl::CDate::Convert2Second(), _structDateSecond::nbSeconds, _structDateSecond::refDate, and brathl::CDate::SetDate().

Referenced by FTN_NAME().

6.8 C API for reading data

Functions

- LIBRATHL_API void **brathl_LoadAliasesDictionary** ()
- LIBRATHL_API int32_t **brathl_ReadData** (int32_t nbFiles, char **fileNames, const char *recordName, const char *selection, int32_t nbData, char **dataExpressions, char **units, double **results, int32_t sizes[], size_t *actualSize, int ignoreOutOfRange, int statistics, double defaultValue)
- LIBRATHL_API void **brathl_RegisterAlgorithms** ()

6.8.1 Detailed Description

6.8.2 Function Documentation

6.8.2.1 LIBRATHL_API int32_t brathl_ReadData (int32_t nbFiles, char ** fileNames, const char * recordName, const char * selection, int32_t nbData, char ** dataExpressions, char ** units, double ** results, int32_t sizes[], size_t * actualSize, int ignoreOutOfRange, int statistics, double defaultValue)

Read data from a set of files Each measure for a data is a scalar value (a single number)

Parameters

in	<i>nbFiles</i>	: Number of files in file name list This is the usable size of #fileNames
in	<i>fileNames</i>	: File name list Must contain at least #nbFiles entries. If an entry is NULL or points to an empty string, the entry is ignored.
in	<i>selection</i>	: Expression involving data fields which has to be true to select returned data if NULL or empty string no selection is done (all data is selected)
in	<i>nbData</i>	: Number of expression used to retrieve data
in	<i>dataExpressions</i>	: Expression applied to data fields to build the wanted value Must contain at least #nbData entries. If an entry is NULL or points to an empty string, the data returned are always default values.
in	<i>units</i>	: Wanted unit for each expression Must be NULL or contain at least #nbData entries. If NULL, no unit conversion is done. If an entry is NULL or points to an empty string, no unit conversion is applied to the data of the corresponding expression. When a unit conversion has to be applied, the result of the expression is considered to be the base unit (SI). For example if the wanted unit is gram/l, the unit of the expression is supposed to be kilogram/m3 (internally all data are converted to base unit of the actual fields unit which is coherent with the above assumption).
	<i>results</i>	[in/out] : Data read Must be a vector of at least #nbData pointers (entries) to values to read. If NULL, nothing is returned in results and sizes MUST be NULL (otherwise this is an error). An entry can be NULL, see #sizes for the actual behaviour.
	<i>sizes</i>	[in/out] : Number of allocated values in a #results entry. Must be a vector of at least #nbData integers. If NULL, results MUST also be NULL (otherwise this is an error). If a value is 0, nothing is returned. If a value is > 0, the corresponding entry in results must not be NULL and must have been allocated to be able to store as much float values as indicated. If a value is < 0, and the corresponding entry in results is NULL, the entry will be allocated with enough space to store the result and sizes modified to reflect the size of allocated data (may be more than actual used ones). If a value is < 0, and the corresponding entry in results is not NULL, this is an error.
out	<i>actualSize</i>	: Number of actual data needed to store result. It cannot be NULL. The actual number of values in the corresponding entry of #results are returned in this number (all entries need the same amount of result). If #result is NULL, the number of values which would be needed for each entry is returned.

in	<i>ignoreOutOfRange</i>	: Skip excess data. 0=false, other = true If true, #actualSize can be greater than any positive value of #sizes, if there is too much value to store they are ignored. If false, it generates an error. Has no effect on #sizes entries which are <= 0 (or if it is NULL).
in	<i>statistics</i>	: returns statistics on data instead of data themselves 0=false, other = true If statistics is true, ignoreOutOfRange must be false. And sizes must be <=0 or >=5. The returned values for each expression are: <ul style="list-style-type: none"> • Count of <i>valid</i> data taken into account. Invalid data are those which are equal to the default/missing value • Mean of the valid data. • Standard deviation of the valid data • Minimum value of the valid data • Maximum value of the valid data In this case actualSize always returns 5
in	<i>defaultValue</i>	: value to use for default/missing values This is the value you want to indicate that a value is missing or invalid.

Returns

#BRATHL_SUCCESS or error code

Referenced by FTN_NAME().

6.9.1 Detailed Description

6.9.2 Function Documentation

6.9.2.1 void FTN_NAME (brathlf_setrefuser1 , BRATHLF_SETREFUSER1)

Initializes the date reference user1 from a string See also **brathl_refDate** (p. 341)

Fortran specification

```
SUBROUTINE brathlf_SetRefUser1(dateRefUser)
  CHARACTER(*) dateRefUser
```

Parameters

in	<i>dateRefUser</i> : date string (format: YYYY-MM-DD HH:MN:SS:MS)
----	---

References BRATHL_REF_DATE_USER_LEN, and brathl_refDateUser1.

6.9.2.2 void FTN_NAME (brathlf_setrefuser2 , BRATHLF_SETREFUSER2)

Initializes the date reference user2 from a string See also **brathl_refDate** (p. 341)

Fortran specification

```
SUBROUTINE brathlf_SetRefUser2(dateRefUser)
  CHARACTER(*) dateRefUser
```

Parameters

<i>dateRefUser</i>	: date string (format: YYYY-MM-DD HH:MM:SS:MS)
--------------------	--

References BRATHL_REF_DATE_USER_LEN, and brathl_refDateUser2.

6.9.2.3 INTEGER4 FTN_NAME (brathlf_geterrno , BRATHLF_GETERRNO)

returns **brathl_errno** (p. 345)

Fortran specification

```
INTEGER*4 FUNCTION brathlf_GetErrno()
```

Returns

Last registered error code

6.9.2.4 void FTN_NAME (brathlf_errno2string , BRATHLF_ERRNO2STRING)

Retrieve a string with the error description

With a few exceptions almost all BRATHL functions return an integer that indicate whether the function was able to perform its operations successfully. The return value will be 0 on success and < 0 otherwise. The result is also save in the global variable #brat_errno In case you get a negative value.

```
\par Fortran specification
SUBROUTINE brathlf_errno2string(err, str)<BR>
  INTEGER*4 err
  CHARACTER*(*) str
```

Parameters

in	<i>err</i>	: error code
out	<i>str</i>	: string error description

6.9.2.5 INTEGER4 FTN_NAME (brathlf_seconds2dsm , BRATHLF_SECONDS2DSM)

Converts seconds into a days-seconds-microseconds date, according to refDate parameter

Fortran specification

```
INTEGER*4 FUNCTION brathlf_Seconds2DSM(iRefDateSrc,iSeconds,iRefDateDest,oDays,oSeconds,oMu-
Seconds)
INTEGER*4 iRefDateSrc REAL*8 iSeconds INTEGER*4 iRefDateDest INTEGER*4 oDays INTEGER*4 o-
Seconds INTEGER*4 oMuSeconds
```

Parameters

in	<i>iRefDateSrc</i>	: source date reference (see brathl_refDate (p. 341))
in	<i>iSeconds</i>	: date to convert
in	<i>iRefDateDest</i>	: date reference conversion (see brathl_refDate (p. 341))
out	<i>oDays</i>	: numbers of days
out	<i>oSeconds</i>	: number of seconds
out	<i>oMuSeconds</i>	: numbers of microseconds

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_Seconds2DSM(), _structDateDSM::days, _structDateDSM::muSeconds, _structDateSecond::nbSeconds, _structDateSecond::refDate, and _structDateDSM::seconds.

6.9.2.6 INTEGER4 FTN_NAME (brathlf_dsm2seconds , BRATHLF_DSM2SECONDS)

Converts a date in days-seconds-microseconds into a seconds, according to refDate parameter

Fortran specification

```

INTEGER*4 FUNCTION brathlf_DSM2Seconds(iRefDateSrc,iDays,iSeconds,iMuSeconds,iRefDateDest,o-
Seconds)
INTEGER*4 iRefDateSrc INTEGER*4 iDays INTEGER*4 iSeconds INTEGER*4 iMuSeconds INTEGER*4
iRefDateDest REAL*8 oSeconds

```

Parameters

in	<i>iRefDateSrc</i>	: source date reference (see brathl_refDate (p. 341))
in	<i>iDays</i>	: numbers of days
in	<i>iSeconds</i>	: number of seconds
in	<i>iMuSeconds</i>	: numbers of microseconds
in	<i>iRefDateDest</i>	: date reference conversion (see brathl_refDate (p. 341))
out	<i>oSeconds</i>	: date to convert

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_DSM2Seconds(), _structDateDSM::days, _structDateDSM::muSeconds, _structDateSecond::nbSeconds, _structDateDSM::refDate, and _structDateDSM::seconds.

6.9.2.7 INTEGER4 FTN_NAME (brathlf_julian2dsm , BRATHLF_JULIAN2DSM)

Converts a decimal julian date into a days-seconds-microseconds date, according to refDate parameter

Fortran specification

```

INTEGER*4 FUNCTION brathlf_Julian2DSM(iRefDateSrc,iJulian,iRefDateDest,oDays,oSeconds,oMu-
Seconds)
INTEGER*4 iRefDateSrc REAL*8 iJulian INTEGER*4 iRefDateDest INTEGER*4 oDays INTEGER*4 o-
Seconds INTEGER*4 oMuSeconds

```

Parameters

in	<i>iRefDateSrc</i>	: source date reference (see brathl_refDate (p. 341))
in	<i>iJulian</i>	: decimal julian date
in	<i>iRefDateDest</i>	: date reference conversion (see brathl_refDate (p. 341))
out	<i>oDays</i>	: numbers of days
out	<i>oSeconds</i>	: number of seconds
out	<i>oMuSeconds</i>	: numbers of microseconds

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_Julian2DSM(), _structDateDSM::days, _structDateJulian::julian, _structDateDSM::muSeconds, _structDateJulian::refDate, and _structDateDSM::seconds.

6.9.2.8 INTEGER4 FTN_NAME (brathlf_dsm2julian , BRATHLF_DSM2JULIAN)

Converts a days-seconds-microseconds date into a decimal julian date, according to refDate parameter

Fortran specification

```
INTEGER*4 FUNCTION brathlf_DSM2Julian(iRefDateSrc,iDays,iSeconds,iMuSeconds,iRefDateDest,oJulian)
INTEGER*4 iRefDateSrc INTEGER*4 iDays INTEGER*4 iSeconds INTEGER*4 iMuSeconds INTEGER*4
iRefDateDest REAL*8 oJulian
```

Parameters

in	<i>iRefDateSrc</i>	: source date reference (see brathl_refDate (p. 341))
in	<i>iDays</i>	: numbers of days
in	<i>iSeconds</i>	: number of seconds
in	<i>iMuSeconds</i>	: numbers of microseconds
in	<i>iRefDateDest</i>	: date reference conversion (see brathl_refDate (p. 341))
out	<i>oJulian</i>	: date to convert

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_DSM2Julian(), _structDateDSM::days, _structDateJulian::julian, _structDateDSM::muSeconds, _structDateDSM::refDate, and _structDateDSM::seconds.

6.9.2.9 INTEGER4 FTN_NAME (brathlf_ymdhmsm2dsm , BRATHLF_YMDHMSM2DSM)

Converts a year, month, day, hour, minute, second, microsecond date into a days-seconds-microseconds date, according to refDate parameter

Fortran specification

```
INTEGER*4 FUNCTION brathlf_YMDHMSM2DSM(iYear,iMonth,iDay,iHour,iMinute,iSecond,iMuSecond,iRef-
DateDest,oDays,oSeconds,oMuSeconds)
```

```
INTEGER*4 iYear, INTEGER*4 iMonth, INTEGER*4 iDay, INTEGER*4 iHour, INTEGER*4 iMinute, INTEGER*4
iSecond, INTEGER*4 iMuSecond, INTEGER*4 iRefDateDest, INTEGER*4 oDays, INTEGER*4 oSeconds, INTE-
GER*4 oMuSeconds
```

Parameters

in	<i>iYear</i>	: year
in	<i>iMonth</i>	: month
in	<i>iDay</i>	: day
in	<i>iHour</i>	: hour
in	<i>iMinute</i>	: minute
in	<i>iSecond</i>	: second
in	<i>iMuSecond</i>	: micro-second
in	<i>iRefDateDest</i>	: date reference conversion (see brathl_refDate (p. 341))
out	<i>oDays</i>	: numbers of days
out	<i>oSeconds</i>	: number of seconds
out	<i>oMuSeconds</i>	: numbers of microseconds

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_YMDHMSM2DSM(), _structDateDSM::days, _structDateDSM::muSeconds, and _structDateDSM::seconds.

6.9.2.10 INTEGER4 FTN_NAME (brathlf_dsm2ymdhmsm , BRATHLF_DSM2YMDHMSM)

Converts a days-seconds-microseconds date into a year, month, day, hour, minute, second, microsecond date according to refDate parameter

Fortran specification

```
INTEGER*4 FUNCTION brathlf_DSM2MDHMSM(iRefDateSrc,iDays,iSeconds,iMuSeconds,oYear,oMonth,oDay,oHour,oMinute,oSecond,oMuSecond)
```

INTEGER*4 iRefDateSrc, INTEGER*4 iDays, INTEGER*4 iSeconds, INTEGER*4 iMuSeconds INTEGER*4 oYear, INTEGER*4 oMonth, INTEGER*4 oDay, INTEGER*4 oHour, INTEGER*4 oMinute, INTEGER*4 oSecond, INTEGER*4 oMuSecond,

Parameters

in	<i>iRefDateSrc</i>	: source date reference (see brathl_refDate (p. 341))
in	<i>iDays</i>	: numbers of days
in	<i>iSeconds</i>	: number of seconds
in	<i>iMuSeconds</i>	: numbers of microseconds
out	<i>oYear</i>	: year
out	<i>oMonth</i>	: month
out	<i>oDay</i>	: day
out	<i>oHour</i>	: hour convert
out	<i>oMinute</i>	: minute to convert
out	<i>oSecond</i>	: second to convert
out	<i>oMuSecond</i>	: micro-second to convert

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_DSM2YMDHMSM(), _structDateDSM::days, _structDateDSM::muSeconds, _structDateDSM::refDate, and _structDateDSM::seconds.

6.9.2.11 INTEGER4 FTN_NAME (brathlf_seconds2julian , BRATHLF_SECONDS2JULIAN)

Converts seconds into a decimal julian date, according to refDate parameter INTEGER*4 FUNCTION brathlf_Seconds2Julian(iRefDateSrc,iSeconds,iRefDateDest,oJulian)

Fortran specification

INTEGER*4 iRefDateSrc, INTEGER*4 iSeconds, INTEGER*4 iRefDateDest REAL*8 oJulian,

Parameters

in	<i>iRefDateSrc</i>	: source date reference (see brathl_refDate (p. 341))
in	<i>iSeconds</i>	: number of seconds
in	<i>iRefDateDest</i>	: date reference conversion (see brathl_refDate (p. 341))
out	<i>oJulian</i>	: julian date

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_Seconds2Julian(), _structDateJulian::julian, _structDateSecond::nbSeconds, and _structDateSecond::refDate.

6.9.2.12 INTEGER4 FTN.NAME (brathlf_julian2seconds , BRATHLF_JULIAN2SECONDS)

Converts a decimal julian date into seconds, according to refDate parameter INTEGER*4 FUNCTION brathlf_Seconds2Julian(iRefDateSrc,iJulian,iRefDateDest,oSeconds)

Fortran specification

INTEGER*4 iRefDateSrc, REAL*8 iJulian, INTEGER*4 iRefDateDest INTEGER*4 oSeconds,

Parameters

in	<i>iRefDateSrc</i>	: source date reference (see brathl_refDate (p. 341))
in	<i>iJulian</i>	: julian date
in	<i>iRefDateDest</i>	: date reference conversion (see brathl_refDate (p. 341))
out	<i>oSeconds</i>	: number of seconds

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_Julian2Seconds(), _structDateJulian::julian, _structDateSecond::nbSeconds, and _structDateJulian::refDate.

6.9.2.13 INTEGER4 FTN.NAME (brathlf_seconds2ymdhmsm , BRATHLF_SECONDS2YMDHMSM)

Converts seconds into into a year, month, day, hour, minute, second, microsecond date, according to refDate parameter INTEGER*4 FUNCTION brathlf_Seconds2YMDHMSM(iRefDateSrc,iSeconds,oYear,oMonth,oDay,oHour,oMinute,oSecond,oMuSecond)

Fortran specification

INTEGER*4 iRefDateSrc, INTEGER*4 iSeconds, INTEGER*4 iRefDateDest INTEGER*4 oYear, INTEGER*4 oMonth, INTEGER*4 oDay, INTEGER*4 oHour, INTEGER*4 oMinute, INTEGER*4 oSecond, INTEGER*4 oMuSecond,

Parameters

in	<i>iRefDateSrc</i>	: source date reference (see brathl_refDate (p. 341))
in	<i>iSeconds</i>	: number of seconds
out	<i>oYear</i>	: year
out	<i>oMonth</i>	: month
out	<i>oDay</i>	: day
out	<i>oHour</i>	: hour convert
out	<i>oMinute</i>	: minute to convert
out	<i>oSecond</i>	: second to convert
out	<i>oMuSecond</i>	: micro-second to convert

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_Seconds2YMDHMSM(), _structDateSecond::nbSeconds, and _structDateSecond::refDate.

6.9.2.14 INTEGER4 FTN.NAME (brathlf_ymdhmsm2seconds , BRATHLF_YMDHMSM2SECONDS)

Converts a year, month, day, hour, minute, second, microsecond date into seconds, according to refDate parameter

Fortran specification

```
INTEGER*4 FUNCTION brathlf_YMDHMSM2DSM(iYear,iMonth,iDay,iHour,iMinute,iSecond,iMuSecond,iRefDateDest,oSeconds)
```

INTEGER*4 iYear, INTEGER*4 iMonth, INTEGER*4 iDay, INTEGER*4 iHour, INTEGER*4 iMinute, INTEGER*4 iSecond, INTEGER*4 iMuSecond, INTEGER*4 iRefDateDest, INTEGER*4 oSeconds,

Parameters

in	<i>iYear</i>	: year
in	<i>iMonth</i>	: month
in	<i>iDay</i>	: day
in	<i>iHour</i>	: hour
in	<i>iMinute</i>	: minute
in	<i>iSecond</i>	: second
in	<i>iMuSecond</i>	: micro-second
in	<i>iRefDateDest</i>	: date reference conversion (see brathl_refDate (p. 341))
out	<i>oSeconds</i>	: number of seconds

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_YMDHMSM2Seconds(), and _structDateSecond::nbSeconds.

6.9.2.15 INTEGER4 FTN.NAME (brathlf_julian2ymdhmsm , BRATHLF_JULIAN2YMDHMSM)

Converts julian date into into a year, month, day, hour, minute, second, microsecond date, according to refDate parameter
 INTEGER*4 FUNCTION brathl_Julian2YMDHMSM(iRefDateSrc,iJulian,oYear,oMonth,oDay,oHour,oMinute,oSecond,oMuSecond)

Fortran specification

INTEGER*4 iRefDateSrc, REAL*8 iJulian, INTEGER*4 oYear, INTEGER*4 oMonth, INTEGER*4 oDay, INTEGER*4 oHour, INTEGER*4 oMinute, INTEGER*4 oSecond, INTEGER*4 oMuSecond,

Parameters

in	<i>iRefDateSrc</i>	: source date reference (see brathl_refDate (p. 341))
in	<i>iJulian</i>	: julian date
out	<i>oYear</i>	: year
out	<i>oMonth</i>	: month
out	<i>oDay</i>	: day
out	<i>oHour</i>	: hour convert
out	<i>oMinute</i>	: minute to convert
out	<i>oSecond</i>	: second to convert
out	<i>oMuSecond</i>	: micro-second to convert

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_Julian2YMDHMSM(), _structDateJulian::julian, and _structDateJulian::refDate.

6.9.2.16 INTEGER4 FTN_NAME (brathlf_ymdhmsm2julian , BRATHLF_YMDHMSM2JULIAN)

Converts a year, month, day, hour, minute, second, microsecond date into a decimal julian date, according to refDate parameter

Fortran specification

```
INTEGER*4 FUNCTION brathlf_YMDHMSM2Julian(iYear,iMonth,iDay,iHour,iMinute,iSecond,iMuSecond,iRefDateDest,oJulian)
```

INTEGER*4 iYear, INTEGER*4 iMonth, INTEGER*4 iDay, INTEGER*4 iHour, INTEGER*4 iMinute, INTEGER*4 iSecond, INTEGER*4 iMuSecond, INTEGER*4 iRefDateDest, REAL*8 oJulian,

Parameters

in	<i>iYear</i>	: year
in	<i>iMonth</i>	: month
in	<i>iDay</i>	: day
in	<i>iHour</i>	: hour
in	<i>iMinute</i>	: minute
in	<i>iSecond</i>	: second
in	<i>iMuSecond</i>	: micro-second
in	<i>iRefDateDest</i>	: date reference conversion (see brathl_refDate (p. 341))
out	<i>oJulian</i>	: julian date

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_YMDHMSM2Julian(), and _structDateJulian::julian.

6.9.2.17 INTEGER4 FTN_NAME (brathlf_nowymdhmsm , BRATHLF_NOWYMDHMSM)

Gets the current date/time,

Fortran specification

```
INTEGER*4 FUNCTION brathlf_NowYMDHMSM(oYear,oMonth,oDay,oHour,oMinute,oSecond,oMuSecond)
```

INTEGER*4 oYear, INTEGER*4 oMonth, INTEGER*4 oDay, INTEGER*4 oHour, INTEGER*4 oMinute, INTEGER*4 oSecond, INTEGER*4 oMuSecond,

Parameters

out	<i>oYear</i>	: year
out	<i>oMonth</i>	: month
out	<i>oDay</i>	: day
out	<i>oHour</i>	: hour convert
out	<i>oMinute</i>	: minute to convert
out	<i>oSecond</i>	: second to convert
out	<i>oMuSecond</i>	: micro-second to convert

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_NowYMDHMSM().

6.9.2.18 INTEGER4 FTN_NAME (brathlf_dayofyear , BRATHLF_DAYOFYEAR)

Retrieves the day of year of a date

Fortran specification

```
INTEGER*4 FUNCTION brathlf_DayOfYear(iYear,iMonth,iDay,iHour,iMinute,iSecond,iMuSecond,iRefDate-
Dest,oSeconds)
```

INTEGER*4 iYear, INTEGER*4 iMonth, INTEGER*4 iDay, INTEGER*4 iHour, INTEGER*4 iMinute, INTEGER*4 iSecond, INTEGER*4 iMuSecond, INTEGER*4 oQuant,

Parameters

in	<i>iYear</i>	: year
in	<i>iMonth</i>	: month
in	<i>iDay</i>	: day
in	<i>iHour</i>	: hour
in	<i>iMinute</i>	: minute
in	<i>iSecond</i>	: second
in	<i>iMuSecond</i>	: micro-second
out	<i>oQuant</i>	: day of year

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_DayOfYear().

6.9.2.19 INTEGER4 FTN_NAME (brathlf_diffymdhmsm , BRATHLF_DIFFYMDHMSM)

Computes the difference between two dates (date1 - date2). The result is expressed in a decimal number of seconds

Fortran specification

```
INTEGER*4 FUNCTION brathl_DiffYMDHMSM(iYear1,iMonth1,iDay1,iHour1,iMinute1,iSecond1,iMu-
Second1,iYear2,iMonth2,iDay2,iHour2,iMinute2,iSecond2,iMuSecond2)
```

INTEGER*4 iYear1, INTEGER*4 iMonth1, INTEGER*4 iDay1, INTEGER*4 iHour1, INTEGER*4 iMinute1, INTEGER*4 iSecond1, INTEGER*4 iMuSecond1, INTEGER*4 iYear2, INTEGER*4 iMonth2, INTEGER*4 iDay2, INTEGER*4 iHour2, INTEGER*4 iMinute2, INTEGER*4 iSecond2, INTEGER*4 iMuSecond2, REAL*8 diff

Parameters

in	<i>iYear1</i>	: year
in	<i>iMonth1</i>	: month
in	<i>iDay1</i>	: day
in	<i>iHour1</i>	: hour
in	<i>iMinute1</i>	: minute
in	<i>iSecond1</i>	: second
in	<i>iMuSecond1</i>	: micro-second
in	<i>iYear2</i>	: year
in	<i>iMonth2</i>	: month
in	<i>iDay2</i>	: day

in	<i>iHour2</i>	: hour
in	<i>iMinute2</i>	: minute
in	<i>iSecond2</i>	: second
in	<i>iMuSecond2</i>	: micro-second
out	<i>diff</i>	: difference in seconds (date1 - date2)

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_DiffYMDHMSM().

6.9.2.20 INTEGER4 FTN.NAME (brathlf_diffdsm , BRATHLF_DIFFDSM)

Computes the difference between two dates (date1 - date2). The result is expressed in a decimal number of seconds

Fortran specification

```
INTEGER*4 FUNCTION brathl_DiffDSM(iRefDate1,iDays1,iSeconds1,iMuSeconds1,iRefDate2,iDays2,iSeconds2,iMuSeconds2,diff)
```

INTEGER*4 iRefDate1, INTEGER*4 iDays1, INTEGER*4 iSeconds1, INTEGER*4 iMuSeconds1, INTEGER*4 iRefDate2, INTEGER*4 iDays2, INTEGER*4 iSeconds2, INTEGER*4 iMuSeconds2 REAL*8 diff

Parameters

in	<i>iRefDate1</i>	: source date reference (see brathl_refDate (p. 341))
in	<i>iDays1</i>	: numbers of days
in	<i>iSeconds1</i>	: number of seconds
in	<i>iMuSeconds1</i>	: numbers of microseconds
in	<i>iRefDate2</i>	: source date reference (see brathl_refDate (p. 341))
in	<i>iDays2</i>	: numbers of days
in	<i>iSeconds2</i>	: number of seconds
in	<i>iMuSeconds2</i>	: numbers of microseconds
out	<i>diff</i>	: difference in seconds (date1 - date2)

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_DiffDSM(), _structDateDSM::days, _structDateDSM::muSeconds, _structDateDSM::refDate, and _structDateDSM::seconds.

6.9.2.21 INTEGER4 FTN.NAME (brathlf_diffjulian , BRATHLF_DIFFJULIAN)

Computes the difference between two dates (date1 - date2). The result is expressed in a decimal number of seconds

Fortran specification

```
INTEGER*4 FUNCTION brathl_DiffJulian(iRefDate1,iJulian1,iRefDate2,iJulian2,diff)
```

INTEGER*4 iRefDate1, REAL*8 iJulian1, INTEGER*4 iRefDate2, REAL*8 iJulian2, REAL*8 diff

Parameters

in	<i>iRefDate1</i>	: source date reference (see brathl_refDate (p. 341))
in	<i>iJulian1</i>	: julian date
in	<i>iRefDate2</i>	: source date reference (see brathl_refDate (p. 341))
in	<i>iJulian2</i>	: julian date
out	<i>diff</i>	: difference in seconds (date1 - date2)

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_DiffJulian(), _structDateJulian::julian, and _structDateJulian::refDate.

6.9.2.22 INTEGER4 FTN.NAME (brathlf_cycle2ymdhmsm , BRATHLF_CYCLE2YMDHMSM)

Converts a cyle/pass into a date

Fortran specification

```
INTEGER*4 FUNCTION brathl_Cycle2YMDHMSM(iMission,iCycle,iPass,oYear,oMonth,oDay,oHour,oMinute,oSecond,oMuSecond)
```

INTEGER*4 iMission, INTEGER*4 iCycle, INTEGER*4 iPass, INTEGER*4 oYear, INTEGER*4 oMonth, INTEGER*4 oDay, INTEGER*4 oHour, INTEGER*4 oMinute, INTEGER*4 oSecond, INTEGER*4 oMuSecond,

Parameters

in	<i>iMission</i>	: mission type (see brathl_mission (p. 341))
in	<i>iCycle</i>	: number of cycle to convert
in	<i>iPass</i>	: number of pass in the cycle to convert
out	<i>oYear</i>	: year
out	<i>oMonth</i>	: month
out	<i>oDay</i>	: day
out	<i>oHour</i>	: hour
out	<i>oMinute</i>	: minute
out	<i>oSecond</i>	: second
out	<i>oMuSecond</i>	: micro-second

Returns

#BRATHL_SUCCESS or error code (see Cycle_date_error_codes)

References brathl_Cycle2YMDHMSM().

6.9.2.23 INTEGER4 FTN.NAME (brathlf_ymdhmsm2cycle , BRATHLF_YMDHMSM2CYCLE)

Converts a date into a cycle/pass

Fortran specification

```
INTEGER*4 FUNCTION brathl_YMDHMSM2Cycle(iMission,iYear,iMonth,iDay,iHour,iMinute,iSecond,iMuSecond,oCycle,oPass)
```

INTEGER*4 iMission, INTEGER*4 iYear, INTEGER*4 iMonth, INTEGER*4 iDay, INTEGER*4 iHour, INTEGER*4 iMinute, INTEGER*4 iSecond, INTEGER*4 iMuSecond, INTEGER*4 oCycle, INTEGER*4 oPass,

Parameters

in	<i>iMission</i>	: mission type (see brathl_mission (p. 341))
in	<i>iYear</i>	: year
in	<i>iMonth</i>	: month
in	<i>iDay</i>	: day
in	<i>iHour</i>	: hour
in	<i>iMinute</i>	: minute
in	<i>iSecond</i>	: second
in	<i>iMuSecond</i>	: micro-second
out	<i>oCycle</i>	: number of cycle to convert
out	<i>oPass</i>	: number of pass in the cycle to convert

Returns

#BRATHL_SUCCESS or error code (see Cycle_date_error_codes)

References brathl_YMDHMSM2Cycle().

6.10 Fortran API for reading data

Functions

- INTEGER4 **FTN_NAME** (brathlf_readdata, BRATHLF_READDATA)

6.10.1 Detailed Description

6.10.2 Function Documentation

6.10.2.1 INTEGER4 FTN_NAME (brathlf_readdata , BRATHLF_READDATA)

Read data from a set of files Each measure for a data is a scalar value (a single number)

Fortran specification

```

INTEGER*4 FUNCTION brathlf_ReadData(nbFiles,
$ fileNames,
$ recordName,
$ selection,
$ nbData,
$ dataExpressions,
$ units,
$ results,
$ size,
$ actualSize,
$ ignoreOutOfRange,
$ statistics,
$ defaultValue,
INTEGER*4 nbFiles
CHARACTER*(*) fileNames(nbFiles) CHARACTER*(*) recordName CHARACTER*(*) selection INTEGER*4
nbData CHARACTER*(*) dataExpressions(nbData) CHARACTER*(*) units(nbData) REAL*8 results(size,nb-
Data) INTEGER*4 size INTEGER*4 actualSize INTEGER*4 ignoreOutOfRange INTEGER*4 statistics REA-
L*8 defaultValue

```

Parameters

in	<i>nbFiles</i>	: Number of files in file name list This is the usable size of #fileNames
in	<i>fileNames</i>	: File name list Must contain at least #nbFiles entries. If an entry is an empty string, the entry is ignored.
in	<i>selection</i>	: Expression involving data fields which has to be true to select returned data if it is an empty string no selection is done (all data is selected)
in	<i>nbData</i>	: Number of expressions used to retrieve data
in	<i>dataExpressions</i>	: Expression applied to data fields to build the wanted value Must contain at least #nbData entries. If an entry is an empty string, the data returned are always default values.
in	<i>units</i>	: Wanted unit for each expression Must contain at least #nbData entries. If an entry is an empty string, no unit conversion is applied to the data of the corresponding expression. When a unit conversion has to be applied, the result of the expression is considered to be the base unit (SI). For example if the wanted unit is gram/l, the unit of the expression is supposed to be kilogram/m3 (internaly all data are converted to base unit of the actual fields unit which is coherent with the above assumption).
out	<i>results</i>	: Data read Must be a matrix of at least #nbData entries of size values. Must be declared as real*8 results[size, N] where N >= #nbData
in	<i>size</i>	: Number of data in each #results entry. Must be >=0. If 0, nothing is returned in results and results can be anything.

out	<i>actualSize</i>	: Number of actual data needed to store result. The actual number of values in the corresponding entry of #results are returned in this number. If size is 0 this is the number of values that would have been returned.
in	<i>ignoreOutOfRange</i>	: Skip excess data. 0=false, other = true. If true, #actualSize can be greater than any positive value of #sizes, if there is too much value to store they are ignored. If false, it generates an error.
in	<i>statistics</i>	: returns statistics on data instead of data themselves. 0=false, other = true. If statistics is true, ignoreOutOfRange must be false. And sizes must be ≤0 or ≥5. The returned values for each expression are: <ul style="list-style-type: none"> • Count of <i>valid</i> data taken into account. Invalid data are those which are equal to the default/missing value • Mean of the valid data. • Standard deviation of the valid data • Minimum value of the valid data • Maximum value of the valid data In this case actualSize always returns 5
in	<i>defaultValue</i>	: value to use for default/missing values. This is the value you want to indicate that a value is missing or invalid.

Returns

#BRATHL_SUCCESS or error code

References `brathl_ReadData()`.

7.1.1 Detailed Description

object base class

Version

1.0

7.1.2 Typedef Documentation

7.1.2.1 typedef std::vector<DoublePtr> brathl::doubleptrarray

Creates a type name for double pointer array

7.1.2.2 typedef std::list<int32_t> brathl::intlist

Creates a type name for int std::list

7.1.2.3 typedef std::map<std::string, CParameter*> brathl::map_parameter

Creates a type name for std::map parameter base class

7.1.2.4 typedef std::map<std::string, double> brathl::mapdouble

Creates a type name for std::map pointer base class

7.1.2.5 typedef std::map<double, DoublePtr*> brathl::mapdoubledoubleptr

Creates a type name for std::map pointer base class

7.1.2.6 typedef std::map<double, CBratObject*> brathl::mapdoubleobject

Creates a type name for std::map object base class

7.1.2.7 typedef std::map<std::string, int32_t> brathl::mapint

Creates a type name for std::map int base class

7.1.2.8 typedef std::map<int32_t, CBratObject*> brathl::mapintobject

Creates a type name for std::map object base class

7.1.2.9 typedef std::map<std::string, CBratObject*> brathl::mapobject

Creates a type name for std::map object base class

7.1.2.10 typedef std::map<std::string, void*> brathl::mapptr

Creates a type name for std::map pointer base class

7.1.2.11 typedef std::map<std::string, std::string> brathl::mapstring

Creates a type name for std::map object base class

7.1.2.12 typedef std::map<std::string, uint32_t> brathl::mapuint

Creates a type name for std::map unsigned int base class

7.1.2.13 typedef std::vector<CBratObject*> brathl::obarray

Creates a type name for object array

7.1.2.14 typedef std::list<CBratObject*> brathl::oblist

Creates a type name for object std::list

7.1.2.15 typedef std::stack<CBratObject*> brathl::obstack

Creates a type name for object std::stack

7.1.2.16 typedef std::vector<std::string> brathl::stringarray

Creates a type name for std::string array

7.1.2.17 typedef std::list<std::string> brathl::stringlist

Creates a type name for std::string std::list

7.1.3 Variable Documentation**7.1.3.1 const DefCharFunction1 brathl::CharFonctions1[] [static]**

Initial value:

```

{
    DefCharFunction1("to_date",      "Translates a std::string value into a
    date value"
        "\nAllowed format are:"
        "\n\n YYYY-MM-DD HH:MM:SS.MS

    std::string."
        "\n For instance:"
        "\n '1995-12-05 12:02:10.1230'"
        "\n '1995-12-05 12:02:10'"
        "\n '1995-12-05'"
        "\n\n a julian std::string:
    format:positive 'Days Seconds Microseconds'"
        "\n Seconds must be strictly less 86400
    and Microseconds must be strictly less than 1000000"
        "\n For instance:"
        "\n '2530 230 4569'"
        "\n\n a julian std::string:
    format:positive decimal julian day"
        "\n For instance:"
        "\n '850.2536985'"
        "\n\nFor julian std::string, it can
    contain its reference date at the end by specifying @YYYY where YYYY is the
    reference year"
        " that's must be one of 1950, 1958,
    1985, 1990, 2000"
        "\nThe reference year YYYY stands for
    YYYY-01-01 00:00:00.0"
        "\nIf no reference date is specified
    the default reference date (1950) is used."
        "\n For instance:"
        "\n '2530 230 4569@2000'"
        "\n '850.2536985@1990'"
        "\n '850.2536985@1950' is equal to
    '850.2536985'"
        "\n\nDates prior to 1950-01-01
    00:00:00.0 are invalid",
        NULL, CDate::CvDate, DateTime),
}

```

7.1.3.2 const DefConstant brathl::Constants[] [static]

Initial value:

```

{
    DefConstant("PI",      "PI value",      M_PI),
    DefConstant("PI2",     "PI/2 value",     M_PI_2),
    DefConstant("PI4",     "PI/4 value",     M_PI_4),
    DefConstant("DV",      "Default value",  CTools::m_defaultValueDOUBLE)
    ,
    DefConstant("dv",      "Default value",  CTools::m_defaultValueDOUBLE)
}

```

7.1.3.3 const DefFunction2 brathl::Fonctions2[] [static]

Initial value:

```

{
    DefFunction2("max",      "Calculates the larger of two values",
        CTools::Max,      Statistical),
    DefFunction2("min",      "Calculates the smaller of two values",
        CTools::Min,      Statistical),
    DefFunction2("mod",      "Calculates the floating-point
    remainder",
        CTools::Mod),
    DefFunction2("deg_normalize", "Normalizes longitude (degree)",
        CTools::NormalizeLongitude, Geographical),
    DefFunction2("rnd",      "Calculates the rounded value with a
    decimal precision (e.g round(20.23645, 3) ==> 20.236)",
        CTools::Rnd,      MathTrigo, false),
}

```

7.1.3.4 `const DefFunction3 brathl::Fonctions3[]` `[static]`**Initial value:**

```
{
    DefFunction3("is_bounded",          "Checks if a value x is
    included between two value (min/max). \nis_bounded(min, x, max)",
                CTools::IsBounded,    Relational),

    DefFunction3("is_bounded_strict",    "Checks if a value x is stricly
    included between two value (min/max). \nis_bounded_strict(min, x, max)",
                CTools::IsBoundedStrict, Relational),

}
```

```
{
    DefFunctionAlgoN("exec",            "Execute an algorithm with
    variable arguments",
                    NULL,    Algorithm),
}
```

7.1.3.6 `const DefFunctionBratAlgoBaseN brathl::FonctionsBratAlgoBaseN[]` `[static]`**Initial value:**

```
{
    DefFunctionBratAlgoBaseN(
        CBratAlgorithmBase::ExecInternal),
}
```

8 Class Documentation

8.1 `_structDateDSM` Struct Reference

```
#include <brathl.h>
```

Public Attributes

- `int32_t days`
- `int32_t muSeconds`
- **`brathl_refDate refDate`**
- `int32_t seconds`

8.1.1 Detailed Description

Day/seconds/microseconds date structure

8.1.2 Member Data Documentation

8.1.2.1 `int32_t _structDateDSM::days`

numbers of days

Referenced by `brathl_Julian2DSM()`, `brathl_Seconds2DSM()`, `brathl_YMDHMSM2DSM()`, `FTN_NAME()`, and `brathl::CDate::SetDate()`.

8.1.2.2 `int32_t _structDateDSM::muSeconds`

numbers of microseconds

Referenced by `brathl_Julian2DSM()`, `brathl_Seconds2DSM()`, `brathl_YMDHMSM2DSM()`, `FTN_NAME()`, and `brathl::CDate::SetDate()`.

8.1.2.3 `brathl_refDate _structDateDSM::refDate`

date reference (see `brathl_refDate` (p. 341))

Referenced by `brathl_Julian2DSM()`, `brathl_Seconds2DSM()`, `brathl_YMDHMSM2DSM()`, `FTN_NAME()`, and `brathl::CDate::SetDate()`.

8.1.2.4 `int32_t _structDateDSM::seconds`

numbers of seconds

Referenced by `brathl_Julian2DSM()`, `brathl_Seconds2DSM()`, `brathl_YMDHMSM2DSM()`, `FTN_NAME()`, and `brathl::CDate::SetDate()`.

The documentation for this struct was generated from the following file:

- `brathl.h`

8.2 `_structDateJulian` Struct Reference

```
#include <brathl.h>
```

Public Attributes

- `double julian`
- `brathl_refDate refDate`

8.2.1 Detailed Description

Decimal julian date structure

8.2.2 Member Data Documentation

8.2.2.1 `double _structDateJulian::julian`

decimal julian day

Referenced by `brathl_DSM2Julian()`, `brathl_Seconds2Julian()`, `brathl_YMDHMSM2Julian()`, `FTN_NAME()`, and `brathl::CDate::SetDate()`.

8.2.2.2 `brathl_refDate _structDateJulian::refDate`

date reference (see `brathl_refDate` (p. 341))

Referenced by `brathl_DSM2Julian()`, `brathl_Seconds2Julian()`, `brathl_YMDHMSM2Julian()`, `FTN_NAME()`, and `brathl::CDate::SetDate()`.

The documentation for this struct was generated from the following file:

- `brathl.h`

8.3 `_structDateSecond` Struct Reference

```
#include <brathl.h>
```

Public Attributes

- double **nbSeconds**
- **brathl_refDate** refDate

8.3.1 Detailed Description

Decimal seconds date structure

8.3.2 Member Data Documentation

8.3.2.1 double `_structDateSecond::nbSeconds`

numbers of seconds/microseconds

Referenced by `brathl_DSM2Seconds()`, `brathl_Julian2Seconds()`, `brathl_YMDHMSM2Seconds()`, `FTN_NAME()`, and `brathl::CDate::SetDate()`.

8.3.2.2 **brathl_refDate** `_structDateSecond::refDate`

date reference (see **brathl_refDate** (p. 341))

Referenced by `brathl_DSM2Seconds()`, `brathl_Julian2Seconds()`, `brathl_YMDHMSM2Seconds()`, `FTN_NAME()`, and `brathl::CDate::SetDate()`.

The documentation for this struct was generated from the following file:

- **brathl.h**

8.4 `_structDateYMDHMSM` Struct Reference

```
#include <brathl.h>
```

Public Attributes

- uint32_t **day**
- uint32_t **hour**
- uint32_t **minute**
- uint32_t **month**
- uint32_t **muSecond**
- uint32_t **second**
- uint32_t **year**

8.4.1 Detailed Description

YYYY-MM-DD HH:MN:SS:MS date structure

The documentation for this struct was generated from the following file:

- **brathl.h**

8.5 brathl::CBratAlgoFilterGaussian1D Class Reference

8.5.1 Detailed Description

Algorithm base class.

8.5.2 Constructor & Destructor Documentation

8.5.2.1 brathl::CBratAlgoFilterGaussian1D::CBratAlgoFilterGaussian1D ()

Default constructor

8.5.2.2 brathl::CBratAlgoFilterGaussian1D::CBratAlgoFilterGaussian1D (const CBratAlgoFilterGaussian1D & copy)

Copy constructor

8.5.2.3 virtual brathl::CBratAlgoFilterGaussian1D::~CBratAlgoFilterGaussian1D () [inline],[virtual]

Destructor

8.5.3 Member Function Documentation

8.5.3.1 void brathl::CBratAlgoFilterGaussian1D::Dump (std::ostream & fOut = std::cerr) [override],[virtual]

Dump function

Reimplemented from **brathl::CBratAlgorithmBase** (p. 124).

8.5.3.2 `virtual std::string bratl::CBratAlgoFilterGaussian1D::GetDescription () const [inline],[override], [virtual]`

Gets the description of the algorithm

Implements **bratl::CBratAlgorithmBase** (p. 125).

8.5.3.3 `virtual std::string bratl::CBratAlgoFilterGaussian1D::GetName () const [inline],[override], [virtual]`

Gets the name of the algorithm

Implements **bratl::CBratAlgorithmBase** (p. 125).

8.5.3.4 `CBratAlgoFilterGaussian1D & bratl::CBratAlgoFilterGaussian1D::operator= (const CBratAlgoFilterGaussian1D & copy)`

Overloads operator '='

8.5.3.5 `double bratl::CBratAlgoFilterGaussian1D::Run (CVectorBratAlgorithmParam & args) [override], [virtual]`

Runs the algorithm

Parameters

<i>fmt</i>	[in] : a std::string that indicates the format of each value of input parameters (number, std::string) : d for integer l for long integer f for double s for std::string
<i>args</i>	[in] : the values of input parameters i(a C/C++ va_list).

Returns

the result of the execution

Implements **bratl::CBratAlgorithmBase** (p. 126).

References **bratl::CTools::Format()**.

The documentation for this class was generated from the following files:

- BratAlgoFilterGaussian1D.h
- BratAlgoFilterGaussian1D.cpp

Dump function

Reimplemented from **brathl::CBratAlgorithmBase** (p. 124).

8.6.3.2 virtual std::string brathl::CBratAlgoFilterGaussian2D::GetDescription () const [inline], [override], [virtual]

Gets the description of the algorithm

Implements **brathl::CBratAlgorithmBase** (p. 125).

8.6.3.3 virtual std::string brathl::CBratAlgoFilterGaussian2D::GetName () const [inline], [override], [virtual]

Gets the name of the algorithm

Implements **brathl::CBratAlgorithmBase** (p. 125).

8.6.3.4 CBratAlgoFilterGaussian2D & bratl::CBratAlgoFilterGaussian2D::operator= (const CBratAlgoFilterGaussian2D & copy)

Overloads operator '='

8.6.3.5 double bratl::CBratAlgoFilterGaussian2D::Run (CVectorBratAlgorithmParam & args) [override], [virtual]

Runs the algorithm

Parameters

<i>fmt</i>	[in] : a std::string that indicates the format of each value of input parameters (number, std::string) : d for integer l for long integer f for double s for std::string
<i>args</i>	[in] : the values of input parameters i(a C/C++ va_list).

Returns

the result of the execution

Implements **bratl::CBratAlgorithmBase** (p. 126).

The documentation for this class was generated from the following files:

- BratAlgoFilterGaussian2D.h
- BratAlgoFilterGaussian2D.cpp

Destructor

8.9.3 Member Function Documentation

8.9.3.1 void brathl::CBratAlgoFilterLoess1D::Dump (std::ostream & fOut = std::cerr) [override], [virtual]

Dump function

Reimplemented from **brathl::CBratAlgorithmBase** (p. 124).

8.9.3.2 virtual std::string brathl::CBratAlgoFilterLoess1D::GetDescription () const [inline], [override], [virtual]

Gets the description of the algorithm

Implements **brathl::CBratAlgorithmBase** (p. 125).

8.9.3.3 virtual std::string brathl::CBratAlgoFilterLoess1D::GetInputParamDesc (uint32_t indexParam) const [inline], [override], [virtual]

Gets the description of an input parameter.

Parameters

<i>indexParam</i>	[in] : parameter index. First parameter index is 0, last one is 'number of parameters - 1'.
-------------------	---

Implements **brathl::CBratAlgorithmBase** (p. 125).

References **brathl::CTools::Format()**.

8.9.3.4 virtual CBratAlgorithmParam::bratAlgoParamTypeVal bratl::CBratAlgoFilterLoess1D::GetInputParamFormat (uint32_t *indexParam*) const [inline], [override], [virtual]

Gets the format of an input parameter : CBratAlgorithmParam::T_DOUBLE for double CBratAlgorithmParam::T_FLOAT for float CBratAlgorithmParam::T_INT for integer CBratAlgorithmParam::T_LONG for long integer CBratAlgorithmParam::T_STRING for std::string CBratAlgorithmParam::T_CHAR for a character

Parameters

<i>indexParam</i>	[in] : parameter index. First parameter index is 0, last one is 'number of parameters - 1'.
-------------------	---

Implements **bratl::CBratAlgorithmBase** (p. 125).

References bratl::CTools::Format().

8.9.3.5 virtual std::string bratl::CBratAlgoFilterLoess1D::GetInputParamUnit (uint32_t *indexParam*) const [inline], [override], [virtual]

Gets the unit of an input parameter :

Parameters

<i>indexParam</i>	[in] : parameter index.
-------------------	-------------------------

Implements **bratl::CBratAlgorithmBase** (p. 125).

References bratl::CTools::Format().

8.9.3.6 virtual std::string bratl::CBratAlgoFilterLoess1D::GetName () const [inline], [override], [virtual]

Gets the name of the algorithm

Implements **bratl::CBratAlgorithmBase** (p. 125).

8.9.3.7 virtual uint32_t bratl::CBratAlgoFilterLoess1D::GetNumInputParam () const [inline], [override], [virtual]

Gets the number of input parameters to pass to the 'Run' function

Implements **bratl::CBratAlgorithmBase** (p. 126).

8.9.3.8 virtual std::string bratl::CBratAlgoFilterLoess1D::GetOutputUnit () const [inline], [override], [virtual]

Gets the unit of an output value returned by the 'Run' function.

Parameters

<i>indexParam</i>	[in] : parameter index.
-------------------	-------------------------

Implements **bratl::CBratAlgorithmBase** (p. 126).

8.9.3.9 CBratAlgoFilterLoess1D & bratl::CBratAlgoFilterLoess1D::operator= (const CBratAlgoFilterLoess1D & *copy*)

Overloads operator '='

8.9.3.10 double bratl::CBratAlgoFilterLoess1D::Run (CVectorBratAlgorithmParam & *args*) [override], [virtual]

Runs the algorithm

Parameters

<i>fmt</i>	[in] : a std::string that indicates the format of each value of input parameters (number, std::string) : d for integer l for long integer f for double s for std::string
<i>args</i>	[in] : the values of input parameters i(a C/C++ va_list).

Returns

the result of the execution

Implements **bratl::CBratAlgorithmBase** (p. 126).

Implements **brathl::CBratAlgorithmBase** (p. 126).

8.11.3.8 `virtual std::string brathl::CBratAlgoFilterMedian1D::GetOutputUnit () const [inline],[override],[virtual]`

Gets the unit of an output value returned by the 'Run' function.

Parameters

<i>indexParam</i>	[in] : parameter index.
-------------------	-------------------------

Implements **brathl::CBratAlgorithmBase** (p. 126).

8.11.3.9 CBratAlgoFilterMedian1D & bratl::CBratAlgoFilterMedian1D::operator= (const CBratAlgoFilterMedian1D & copy)

Overloads operator '='

8.11.3.10 double bratl::CBratAlgoFilterMedian1D::Run (CVectorBratAlgorithmParam & args) [override], [virtual]

Runs the algorithm

Parameters

<i>fmt</i>	[in] : a std::string that indicates the format of each value of input parameters (number, std::string) : d for integer l for long integer f for double s for std::string
<i>args</i>	[in] : the values of input parameters i(a C/C++ va_list).

Returns

the result of the execution

Implements **bratl::CBratAlgorithmBase** (p. 126).

References **bratl::CTools::Format()**.

Destructor

8.12.3 Member Function Documentation

8.12.3.1 void bratl::CBratAlgoFilterMedian2D::Dump (std::ostream & fOut = std::cerr) [override], [virtual]

Dump function

Reimplemented from **bratl::CBratAlgorithmBase** (p. 124).

8.12.3.2 virtual std::string bratl::CBratAlgoFilterMedian2D::GetDescription () const [inline], [override], [virtual]

Gets the description of the algorithm

Implements **bratl::CBratAlgorithmBase** (p. 125).

8.12.3.3 `virtual std::string bratl::CBratAlgoFilterMedian2D::GetInputParamDesc (uint32_t indexParam) const` `[inline]`, `[override]`, `[virtual]`

Gets the description of an input parameter.

Parameters

<i>indexParam</i>	[in] : parameter index. First parameter index is 0, last one is 'number of parameters - 1'.
-------------------	---

Implements **bratl::CBratAlgorithmBase** (p. 125).

References `bratl::CTools::Format()`.

8.12.3.4 `virtual CBratAlgorithmParam::bratAlgoParamTypeVal bratl::CBratAlgoFilterMedian2D::GetInputParamFormat (uint32_t indexParam) const` `[inline]`, `[override]`, `[virtual]`

Gets the format of an input parameter : `CBratAlgorithmParam::T_DOUBLE` for double `CBratAlgorithmParam::T_FLOAT` for float `CBratAlgorithmParam::T_INT` for integer `CBratAlgorithmParam::T_LONG` for long integer `CBratAlgorithmParam::T_STRING` for `std::string` `CBratAlgorithmParam::T_CHAR` for a character

Parameters

<i>indexParam</i>	[in] : parameter index. First parameter index is 0, last one is 'number of parameters - 1'.
-------------------	---

Implements **bratl::CBratAlgorithmBase** (p. 125).

References `bratl::CTools::Format()`.

8.12.3.5 `virtual std::string bratl::CBratAlgoFilterMedian2D::GetInputParamUnit (uint32_t indexParam) const` `[inline]`, `[override]`, `[virtual]`

Gets the unit of an input parameter :

Parameters

<i>indexParam</i>	[in] : parameter index.
-------------------	-------------------------

Implements **bratl::CBratAlgorithmBase** (p. 125).

References `bratl::CTools::Format()`.

8.12.3.6 `virtual std::string bratl::CBratAlgoFilterMedian2D::GetName () const` `[inline]`, `[override]`, `[virtual]`

Gets the name of the algorithm

Implements **bratl::CBratAlgorithmBase** (p. 125).

8.12.3.7 `virtual uint32_t bratl::CBratAlgoFilterMedian2D::GetNumInputParam () const` `[inline]`, `[override]`, `[virtual]`

Gets the number of input parameters to pass to the 'Run' function

Implements **bratl::CBratAlgorithmBase** (p. 126).

8.12.3.8 `virtual std::string bratl::CBratAlgoFilterMedian2D::GetOutputUnit () const` `[inline]`, `[override]`, `[virtual]`

Gets the unit of an output value returned by the 'Run' function.

Parameters

<i>indexParam</i>	[in] : parameter index.
-------------------	-------------------------

Implements **bratl::CBratAlgorithmBase** (p. 126).

8.12.3.9 CBratAlgoFilterMedian2D & bratl::CBratAlgoFilterMedian2D::operator= (const CBratAlgoFilterMedian2D & copy)

Overloads operator '='

8.12.3.10 double bratl::CBratAlgoFilterMedian2D::Run (CVectorBratAlgorithmParam & args) [override], [virtual]

Runs the algorithm

Parameters

<i>fmt</i>	[in] : a std::string that indicates the format of each value of input parameters (number, std::string) : d for integer l for long integer f for double s for std::string
<i>args</i>	[in] : the values of input parameters i(a C/C++ va_list).

Returns

the result of the execution

Implements **bratl::CBratAlgorithmBase** (p. 126).

8.13.1 Detailed Description

Algorithm base class.

8.13.2 Constructor & Destructor Documentation

8.13.2.1 bratl::CBratAlgorithmBase::CBratAlgorithmBase ()

Default contructor

8.13.2.2 bratl::CBratAlgorithmBase::CBratAlgorithmBase (const CBratAlgorithmBase & o)

Copy contructor

8.13.2.3 bratl::CBratAlgorithmBase::~~CBratAlgorithmBase () [virtual]

Destructor

8.13.3 Member Function Documentation

8.13.3.1 void bratl::CBratAlgorithmBase::Dump (std::ostream & fOut = std::cerr) [virtual]

Dump function

Reimplemented in **bratl::CBratAlgorithmGeosVelGridV** (p. 15), **bratl::CBratAlgorithmGeosVelGridU** (p. 15), **bratl::CBratAlgoFilterLoess1D** (p. 110), **bratl::CBratAlgoFilterLoess2D** (p. 113), **bratl::CBratAlgoFilterMedian2D** (p. 119), **bratl::CBratAlgoFilterMedian1D** (p. 116), **bratl::CBratAlgorithmGeosVelGrid** (p. 14),

bratl::CBratAlgorithmGeosVelAtp (p. 131), **bratl::CBratAlgoFilterGaussian2D** (p. 104), **bratl::CBratAlgoFilterLanczos2D** (p. 108), **bratl::CBratAlgoFilterGaussian1D** (p. 102), **bratl::CBratAlgoFilterLanczos1D** (p. 106), and **bratl::CBratAlgorithmGeosVel** (p. 129).

Referenced by `bratl::CBratAlgorithmGeosVel::Dump()`.

8.13.3.2 `virtual std::string bratl::CBratAlgorithmBase::GetDescription () const [pure virtual]`

Gets the description of the algorithm

Implemented in **PyAlgo** (p. 336), **bratl::CBratAlgorithmGeosVelGridV** (p. 15), **bratl::CBratAlgorithmGeosVelGridU** (p. 15), **bratl::CBratAlgoFilterGaussian1D** (p. 103), **bratl::CBratAlgoFilterGaussian2D** (p. 104), **bratl::CBratAlgoFilterLanczos1D** (p. 106), **bratl::CBratAlgoFilterLanczos2D** (p. 108), **bratl::CBratAlgoFilterLoess1D** (p. 110), **bratl::CBratAlgoFilterLoess2D** (p. 113), **bratl::CBratAlgoFilterMedian1D** (p. 116), **bratl::CBratAlgoFilterMedian2D** (p. 119), and **bratl::CBratAlgorithmGeosVelAtp** (p. 131).

8.13.3.3 `virtual std::string bratl::CBratAlgorithmBase::GetInputParamDesc (uint32_t indexParam) const [pure virtual]`

Gets the description of an input parameter.

Parameters

<i>indexParam</i>	[in] : parameter index. First parameter index is 0, last one is 'number of parameters - 1'.
-------------------	---

Implemented in **PyAlgo** (p. 336), **bratl::CBratAlgoFilterLoess1D** (p. 110), **bratl::CBratAlgoFilterLoess2D** (p. 113), **bratl::CBratAlgoFilterMedian1D** (p. 116), **bratl::CBratAlgoFilterMedian2D** (p. 120), **bratl::CBratAlgorithmGeosVelAtp** (p. 132), and **bratl::CBratAlgorithmGeosVelGrid** (p. 15).

8.13.3.4 `virtual CBratAlgorithmParam::bratAlgoParamTypeVal bratl::CBratAlgorithmBase::GetInputParamFormat (uint32_t indexParam) const [pure virtual]`

Gets the format of an input parameter : `CBratAlgorithmParam::T_DOUBLE` for double `CBratAlgorithmParam::T_FLOAT` for float `CBratAlgorithmParam::T_INT` for integer `CBratAlgorithmParam::T_LONG` for long integer `CBratAlgorithmParam::T_STRING` for `std::string` `CBratAlgorithmParam::T_CHAR` for a character

Parameters

<i>indexParam</i>	[in] : parameter index. First parameter index is 0, last one is 'number of parameters - 1'.
-------------------	---

Implemented in **PyAlgo** (p. 337), **bratl::CBratAlgoFilterLoess1D** (p. 111), **bratl::CBratAlgoFilterLoess2D** (p. 114), **bratl::CBratAlgoFilterMedian2D** (p. 120), **bratl::CBratAlgoFilterMedian1D** (p. 117), **bratl::CBratAlgorithmGeosVelAtp** (p. 132), and **bratl::CBratAlgorithmGeosVelGrid** (p. 15).

8.13.3.5 `virtual std::string bratl::CBratAlgorithmBase::GetInputParamUnit (uint32_t indexParam) const [pure virtual]`

Gets the unit of an input parameter :

Parameters

<i>indexParam</i>	[in] : parameter index. First parameter index is 0, last one is 'number of parameters - 1'.
-------------------	---

Implemented in **PyAlgo** (p. 337), **bratl::CBratAlgoFilterLoess1D** (p. 111), **bratl::CBratAlgoFilterLoess2D** (p. 114), **bratl::CBratAlgoFilterMedian2D** (p. 120), **bratl::CBratAlgoFilterMedian1D** (p. 117), **bratl::CBratAlgorithmGeosVelAtp** (p. 132), and **bratl::CBratAlgorithmGeosVelGrid** (p. 15).

8.13.3.6 `virtual std::string bratl::CBratAlgorithmBase::GetName () const [pure virtual]`

Gets the name of the algorithm

Implemented in **PyAlgo** (p. 337), **bratl::CBratAlgorithmGeosVelGridV** (p. 16), **bratl::CBratAlgorithmGeos-**

VelGridU (p. 16), **bratl::CBratAlgoFilterGaussian1D** (p. 103), **bratl::CBratAlgoFilterGaussian2D** (p. 104), **bratl::CBratAlgoFilterLanczos1D** (p. 106), **bratl::CBratAlgoFilterLanczos2D** (p. 108), **bratl::CBratAlgoFilterLoess1D** (p. 111), **bratl::CBratAlgoFilterLoess2D** (p. 114), **bratl::CBratAlgoFilterMedian1D** (p. 117), **bratl::CBratAlgoFilterMedian2D** (p. 120), and **bratl::CBratAlgorithmGeosVelAtp** (p. 132).

8.13.3.7 `virtual uint32_t bratl::CBratAlgorithmBase::GetNumInputParam () const [pure virtual]`

Gets the number of input parameters to pass to the 'Run' function

Implemented in **PyAlgo** (p. 337), **bratl::CBratAlgoFilterLoess1D** (p. 111), **bratl::CBratAlgoFilterLoess2D** (p. 114), **bratl::CBratAlgoFilterMedian1D** (p. 117), **bratl::CBratAlgoFilterMedian2D** (p. 120), **bratl::CBratAlgorithmGeosVelAtp** (p. 132), and **bratl::CBratAlgorithmGeosVelGrid** (p. 16).

8.13.3.8 `virtual std::string bratl::CBratAlgorithmBase::GetOutputUnit () const [pure virtual]`

Gets the unit of an output value returned by the 'Run' function.

Implemented in **PyAlgo** (p. 337), **bratl::CBratAlgoFilterLoess1D** (p. 111), **bratl::CBratAlgoFilterLoess2D** (p. 114), **bratl::CBratAlgoFilterMedian2D** (p. 120), **bratl::CBratAlgoFilterMedian1D** (p. 117), **bratl::CBratAlgorithmGeosVelAtp** (p. 132), and **bratl::CBratAlgorithmGeosVelGrid** (p. 16).

8.13.3.9 `CBratAlgorithmBase & bratl::CBratAlgorithmBase::operator= (const CBratAlgorithmBase & o)`

Overloads operator '='

8.13.3.10 `virtual double bratl::CBratAlgorithmBase::Run (CVectorBratAlgorithmParam & args) [pure virtual]`

Runs the algorithm

Parameters

<i>fmt</i>	[in] : a std::string that indicates the format of each value of input parameters (number, std::string) : d for integer l for long integer f for double s for std::string
<i>args</i>	[in] : the values of input parameters i(a C/C++ va_list).

Returns

the result of the execution

Implemented in **PyAlgo** (p. 338), **bratl::CBratAlgoFilterLoess1D** (p. 111), **bratl::CBratAlgoFilterLoess2D** (p. 115), **bratl::CBratAlgoFilterMedian2D** (p. 121), **bratl::CBratAlgoFilterMedian1D** (p. 118), **bratl::CBratAlgorithmGeosVelAtp** (p. 133), **bratl::CBratAlgorithmGeosVelGrid** (p. 16), **bratl::CBratAlgoFilterGaussian1D** (p. 103), **bratl::CBratAlgoFilterGaussian2D** (p. 105), **bratl::CBratAlgoFilterLanczos1D** (p. 106), and **bratl::CBratAlgoFilterLanczos2D** (p. 108).

8.15.1 Detailed Description

Algorithm base class.

8.15.2 Constructor & Destructor Documentation

8.15.2.1 bratl::CBratAlgorithmGeosVelAtp::CBratAlgorithmGeosVelAtp ()

Default constructor

8.15.2.2 bratl::CBratAlgorithmGeosVelAtp::CBratAlgorithmGeosVelAtp (const CBratAlgorithmGeosVelAtp & copy)

Copy constructor

8.15.2.3 virtual bratl::CBratAlgorithmGeosVelAtp::~CBratAlgorithmGeosVelAtp () [inline], [virtual]

Destructor

8.15.3 Member Function Documentation

8.15.3.1 void bratl::CBratAlgorithmGeosVelAtp::Dump (std::ostream & fOut = std::cerr) [override], [virtual]

Dump function

Reimplemented from **bratl::CBratAlgorithmGeosVel** (p. 129).

References **bratl::CBratAlgorithmGeosVel::Dump()**.

8.15.3.2 virtual std::string bratl::CBratAlgorithmGeosVelAtp::GetDescription () const [inline], [override], [virtual]

Gets the description of the algorithm

Implements **bratl::CBratAlgorithmBase** (p. 125).

8.15.3.3 `virtual std::string bratl::CBratAlgorithmGeosVelAtp::GetInputParamDesc (uint32_t indexParam) const`
`[inline], [override], [virtual]`

Gets the description of an input parameter.

Parameters

<i>indexParam</i>	[in] : parameter index. First parameter index is 0, last one is 'number of parameters - 1'.
-------------------	---

Implements **bratl::CBratAlgorithmBase** (p. 125).

References **bratl::CTools::Format()**.

8.15.3.4 `virtual CBratAlgorithmParam::bratAlgoParamTypeVal bratl::CBratAlgorithmGeosVelAtp::GetInputParamFormat (uint32_t indexParam) const`
`[inline], [override], [virtual]`

Gets the format of an input parameter : CBratAlgorithmParam::T_DOUBLE for double CBratAlgorithmParam::T_FLOAT for float CBratAlgorithmParam::T_INT for integer CBratAlgorithmParam::T_LONG for long integer CBratAlgorithmParam::T_STRING for std::string CBratAlgorithmParam::T_CHAR for a character

Parameters

<i>indexParam</i>	[in] : parameter index. First parameter index is 0, last one is 'number of parameters - 1'.
-------------------	---

Implements **bratl::CBratAlgorithmBase** (p. 125).

References **bratl::CTools::Format()**.

8.15.3.5 `virtual std::string bratl::CBratAlgorithmGeosVelAtp::GetInputParamUnit (uint32_t indexParam) const`
`[inline], [override], [virtual]`

Gets the unit of an input parameter :

Parameters

<i>indexParam</i>	[in] : parameter index.
-------------------	-------------------------

Implements **bratl::CBratAlgorithmBase** (p. 125).

References **bratl::CTools::Format()**.

8.15.3.6 `virtual std::string bratl::CBratAlgorithmGeosVelAtp::GetName () const`
`[inline], [override], [virtual]`

Gets the name of the algorithm

Implements **bratl::CBratAlgorithmBase** (p. 125).

8.15.3.7 `virtual uint32_t bratl::CBratAlgorithmGeosVelAtp::GetNumInputParam () const`
`[inline], [override], [virtual]`

Gets the number of input parameters to pass to the 'Run' function

Implements **bratl::CBratAlgorithmBase** (p. 126).

8.15.3.8 `virtual std::string bratl::CBratAlgorithmGeosVelAtp::GetOutputUnit () const`
`[inline], [override], [virtual]`

Gets the unit of an output value returned by the 'Run' function.

Parameters

<i>indexParam</i>	[in] : parameter index.
-------------------	-------------------------

Implements **bratl::CBratAlgorithmBase** (p. 126).

8.15.3.9 CBratAlgorithmGeosVelAtp & bratl::CBratAlgorithmGeosVelAtp::operator= (const CBratAlgorithmGeosVelAtp & copy)

Overloads operator '='

8.15.3.10 double bratl::CBratAlgorithmGeosVelAtp::Run (CVectorBratAlgorithmParam & args) [override], [virtual]

Runs the algorithm

Parameters

<i>fmt</i>	[in] : a std::string that indicates the format of each value of input parameters (number, std::string) : d for integer l for long integer f for double s for std::string
<i>args</i>	[in] : the values of input parameters i(a C/C++ va_list).

Returns

the result of the execution

Implements **bratl::CBratAlgorithmBase** (p. 126).

Criteria management class.

Version

1.0

8.19.2 Member Enumeration Documentation

8.19.2.1 enum brathl::CCriteria::CriteriaKind

Kind of criteria enumeration.

Enumerator:

UNKNOWN not set
LATLON geographical latitude/longitude area
DATETIME date/time
PASS Pass
CYCLE Cycle

8.19.3 Member Function Documentation

8.19.3.1 virtual bool brathl::CCriteria::IsDefaultValue () [pure virtual]

Tests whether value have been initialized or not

Returns

true if not initialized

Implemented in **brathl::CCriteriaPassInt** (p. 61), **brathl::CCriteriaLatLon** (p. 160), **brathl::CCriteriaDatetime** (p. 151), **brathl::CCriteriaCycle** (p. 145), **brathl::CCriteriaPassString** (p. 61), and **brathl::CCriteriaPass** (p. 60).

8.19.3.2 virtual void brathl::CCriteria::SetDefaultValue () [pure virtual]

Sets internal value to the default value (uninitialized)

Implemented in **brathl::CCriteriaPassInt** (p. 62), **brathl::CCriteriaLatLon** (p. 161), **brathl::CCriteriaDatetime** (p. 152), **brathl::CCriteriaCycle** (p. 145), **brathl::CCriteriaPassString** (p. 62), and **brathl::CCriteriaPass** (p. 62).

8.20.1 Detailed Description

Pass number (from/to) Criteria management class.

Version

1.0

8.20.2 Constructor & Destructor Documentation

8.20.2.1 brathl::CCriteriaCycle::CCriteriaCycle (int32_t from, int32_t to)

Constructor.

Parameters

<i>from</i>	start pass
<i>to</i>	end pass

8.20.2.2 bratl::CCriteriaCycle::CCriteriaCycle (const std::string & *from*, const std::string & *to*)

Constructor.

Parameters

<i>from</i>	start pass
<i>to</i>	end pass

8.20.2.3 bratl::CCriteriaCycle::CCriteriaCycle (const CStringArray & *array*)

Constructor from a array that contains start pass as std::string, end pass as std::string

Parameters

<i>array</i>	start and end dates
--------------	---------------------

8.20.3 Member Function Documentation

8.20.3.1 bool bratl::CCriteriaCycle::Intersect (CStringArray & *array*, CStringArray & *intersect*)

Create the intersection of this date period with the given one

Parameters

<i>array</i>	that contains start pass as std::string, end pass as std::string
<i>intersect</i>	intersection period

Returns

true, or false if there is no intersection

8.20.3.2 bool bratl::CCriteriaCycle::Intersect (CStringArray & *array*, CIntArray & *intersect*)

Create the intersection of this date period with the given one

Parameters

<i>array</i>	that contains start pass as std::string, end pass as std::string
<i>intersect</i>	intersection period

Returns

true, or false if there is no intersection

8.20.3.3 bool bratl::CCriteriaCycle::Intersect (CIntArray & *array*, CStringArray & *intersect*)

Create the intersection of this date period with the given one

Parameters

<i>array</i>	that contains start pass as std::string, end pass as std::string
<i>intersect</i>	intersection period

Returns

true, or false if there is no intersection

8.20.3.4 bool brathl::CCriteriaCycle::Intersect (CIntArray & *array*, CIntArray & *intersect*)

Create the intersection of this date period with the given one

Parameters

<i>array</i>	that contains start pass as std::string, end pass as std::string
<i>intersect</i>	intersection period

Returns

true, or false if there is no intersection

8.20.3.5 bool brathl::CCriteriaCycle::IsDefaultValue () [virtual]

Tests whether the pass have been initialized or not

Returns

true if not initialized

Implements **brathl::CCriteria** (p. 141).

8.20.3.6 void brathl::CCriteriaCycle::Set (int32_t *from*, int32_t *to*)

Sets date period from start and end pass

Parameters

<i>from</i>	start pass
<i>to</i>	end pass

8.20.3.7 void brathl::CCriteriaCycle::Set (const std::string & *from*, const std::string & *to*)

Sets date period from start and end pass

Parameters

<i>from</i>	start pass
<i>to</i>	end pass

References brathl::CTools::StrToInt32().

8.20.3.8 void brathl::CCriteriaCycle::Set (const CStringArray & *array*)

Sets a date period from a array that contains start pass as std::string, end pass as std::string

Parameters

<i>array</i>	start and end dates
--------------	---------------------

8.20.3.9 void brathl::CCriteriaCycle::SetDefaultValue () [virtual]

Sets internal value to the default value (uninitialized)

Implements **brathl::CCriteria** (p. 141).

8.20.3.10 void brathl::CCriteriaCycle::SetFrom (int32_t *from*)

Sets start pass

Parameters

<i>to</i>	start pass
-----------	------------

8.20.3.11 void brathl::CCriteriaCycle::SetFrom (const std::string & *from*)

Sets start pass

Parameters

<i>to</i>	start pass
-----------	------------

References brathl::CTools::StrToInt32().

8.20.3.12 void brathl::CCriteriaCycle::SetTo (int32_t *to*)

Sets end pass

Parameters

<i>to</i>	end pass
-----------	----------

8.20.3.13 void brathl::CCriteriaCycle::SetTo (const std::string & *to*)

Sets end pass

Parameters

<i>to</i>	end pass
-----------	----------

References brathl::CTools::StrToInt32().

8.20.4 Member Data Documentation

8.20.4.1 int32_t brathl::CCriteriaCycle::m_from [protected]

start pass

8.20.4.2 int32_t brathl::CCriteriaCycle::m_to [protected]

end pass

8.22.1 Detailed Description

Datetime Criteria management class.

Version

1.0

8.22.2 Constructor & Destructor Documentation

8.22.2.1 bratl::CCriteriaDatetime::CCriteriaDatetime (CDatePeriod & datePeriod)

Constructor.

Parameters

<i>datePeriod</i>	period to set
-------------------	---------------

8.22.2.2 bratl::CCriteriaDatetime::CCriteriaDatetime (CDate & from, CDate & to)

Constructor.

Parameters

<i>from</i>	start date
<i>to</i>	end date

8.22.2.3 bratl::CCriteriaDatetime::CCriteriaDatetime (const std::string & from, const std::string & to)

Constructor.

Parameters

<i>from</i>	start date
<i>to</i>	end date

8.22.2.4 brathl::CCriteriaDatetime::CCriteriaDatetime (double *from*, double *to*)

Constructor.

Parameters

<i>from</i>	start date (number of seconds since 1950-01-01)
<i>to</i>	end date (number of seconds since 1950-01-01)

8.22.2.5 brathl::CCriteriaDatetime::CCriteriaDatetime (const CStringArray & *array*)

Constructor from a array that contains start date as std::string, end date as std::string

Parameters

<i>array</i>	start and end dates
--------------	---------------------

8.22.3 Member Function Documentation

8.22.3.1 bool brathl::CCriteriaDatetime::Intersect (CDatePeriod & *datePeriod*, CDatePeriod & *intersect*)

Create the intersection of this date period with the given one

Parameters

<i>datePeriod</i>	intersect with this
<i>intersect</i>	intersection period

Returns

true, or false if there is no intersection

8.22.3.2 bool brathl::CCriteriaDatetime::Intersect (double *otherFrom*, double *otherTo*, CDatePeriod & *intersect*)

Create the intersection of this date period with the given one

Parameters

<i>otherFrom</i>	start date intersect with this
<i>otherTo</i>	end date intersect with this
<i>intersect</i>	intersection period

Returns

true, or false if there is no intersection

8.22.3.3 bool brathl::CCriteriaDatetime::IsDefaultValue () [virtual]

Tests whether date period have been initialized or not

Returns

true if not initialized

Implements **brathl::CCriteria** (p. 141).

8.22.3.4 void brathl::CCriteriaDatetime::Set (CDatePeriod & *datePeriod*)

Sets date period from another one

Parameters

<i>datePeriod</i>	period to set
-------------------	---------------

8.22.3.5 void brathl::CCriteriaDatetime::Set (CDate & *from*, CDate & *to*)

Sets date period from start and end date

Parameters

<i>from</i>	start date
<i>to</i>	end date

8.22.3.6 void brathl::CCriteriaDatetime::Set (const std::string & *from*, const std::string & *to*)

Sets date period from start and end date

Parameters

<i>from</i>	start date
<i>to</i>	end date

8.22.3.7 void brathl::CCriteriaDatetime::Set (const CStringArray & *array*)

Sets a date period from a array that contains start date as std::string, end date as std::string

Parameters

<i>array</i>	start and end dates
--------------	---------------------

8.22.3.8 void brathl::CCriteriaDatetime::SetDefaultValue () [virtual]

Sets internal value to the default value (uninitialized)

Implements **brathl::CCriteria** (p. 141).

8.22.3.9 void brathl::CCriteriaDatetime::SetFrom (CDate & *from*)

Sets start date

Parameters

<i>to</i>	start date
-----------	------------

8.22.3.10 void brathl::CCriteriaDatetime::SetFrom (const std::string & *strDate*)

Sets start date

Parameters

<i>to</i>	start date
-----------	------------

8.22.3.11 void brathl::CCriteriaDatetime::SetTo (CDate & *to*)

Sets end date

Parameters

<i>to</i>	end date
-----------	----------

8.22.3.12 void brathl::CCriteriaDatetime::SetTo (const std::string & *strDate*)

Sets end date

Parameters

<i>to</i>	end date
-----------	----------

8.22.4 Member Data Documentation

8.22.4.1 CDatePeriod brathl::CCriteriaDatetime::m_datePeriod [protected]

Date period

The documentation for this class was generated from the following files:

8.25.1 Detailed Description

Latitude/Longitude Criteria management class.

Version

1.0

8.25.2 Constructor & Destructor Documentation

8.25.2.1 brathl::CCriteriaLatLon::CCriteriaLatLon (CLatLonRect & *latLonRect*)

Constructor.

Parameters

<i>latLonRect</i>	lat/lon bounding box
-------------------	----------------------

8.25.2.2 brathl::CCriteriaLatLon::CCriteriaLatLon (CLatLonPoint & *p1*, double *deltaLat*, double *deltaLon*)

Construct a lat/lon bounding box from a point, and a delta lat, lon. This disambiguates which way the box wraps around the globe.

Parameters

<i>p1</i>	one corner of the box
<i>deltaLat</i>	delta lat from p1. (may be positive or negative)
<i>deltaLon</i>	delta lon from p1. (may be positive or negative)

8.25.2.3 brathl::CCriteriaLatLon::CCriteriaLatLon (CLatLonPoint & *latLonLow*, CLatLonPoint & *latLonHigh*)

Constructor.

Parameters

<i>latLonLow</i>	lat/lon low point
<i>latLonHigh</i>	lat/lon high point

8.25.2.4 brathl::CCriteriaLatLon::CCriteriaLatLon (double *latLow*, double *lonLow*, double *latHigh*, double *lonHigh*)

Constructor.

Parameters

<i>latLow</i>	latitude low
<i>lonLow</i>	longitude low
<i>latHigh</i>	latitude high
<i>lonHigh</i>	longitude high

8.25.2.5 brathl::CCriteriaLatLon::CCriteriaLatLon (const std::string & *latLow*, const std::string & *lonLow*, const std::string & *latHigh*, const std::string & *lonHigh*)

Constructor.

Parameters

<i>latLow</i>	latitude low
<i>lonLow</i>	longitude low
<i>latHigh</i>	latitude high
<i>lonHigh</i>	longitude high

8.25.2.6 bratl::CCriteriaLatLon::CCriteriaLatLon (const CStringArray & array)

Constructor from a list that contains low latitude value, low longitude value, high latitude value, high longitude value.

Parameters

<i>array</i>	to be converted
--------------	-----------------

8.25.2.7 bratl::CCriteriaLatLon::~~CCriteriaLatLon () [virtual]

Destructor.

Getter of the property `latLonRect`;

Returns

Returns the `latLonRect`.

8.25.3 Member Function Documentation

8.25.3.1 double bratl::CCriteriaLatLon::GetLowerLeftLat () [inline]

Returns

lower left latitude of the lat/lon box, `Double.MAX_VALUE` if not set.

8.25.3.2 double bratl::CCriteriaLatLon::GetLowerLeftLon () [inline]

Returns

lower left longitude of the lat/lon box, `Double.MAX_VALUE` if not set.

8.25.3.3 double bratl::CCriteriaLatLon::GetLowerRightLat () [inline]

Returns

lower right latitude of the lat/lon box, `Double.MAX_VALUE` if not set.

8.25.3.4 double bratl::CCriteriaLatLon::GetLowerRightLon () [inline]

Returns

lower right longitude of the lat/lon box, `Double.MAX_VALUE` if not set.

8.25.3.5 double bratl::CCriteriaLatLon::GetMinOrMaxLon (double lon1, double lon2, bool wantMin) [static]

Gets the min. or max. of two longitudes.

Parameters

<i>lon1</i>	first longitude
<i>lon2</i>	second longitude
<i>wantMin</i>	true: returns min., false: returns max.

Returns

min. lon or max. lon, depends on wantMin.

References bratl::CTools::Max(), and bratl::CTools::Min().

8.25.3.6 double bratl::CCriteriaLatLon::GetUpperLeftLat () [inline]**Returns**

upper left latitude of the lat/lon box, Double.MAX_VALUE if not set.

8.25.3.7 double bratl::CCriteriaLatLon::GetUpperLeftLon () [inline]**Returns**

upper left longitude of the lat/lon box, Double.MAX_VALUE if not set.

8.25.3.8 double bratl::CCriteriaLatLon::GetUpperRightLat () [inline]**Returns**

upper right latitude of the lat/lon box, Double.MAX_VALUE if not set.

8.25.3.9 double bratl::CCriteriaLatLon::GetUpperRightLon () [inline]**Returns**

upper right longitude of the lat/lon box, Double.MAX_VALUE if not set.

8.25.3.10 bool bratl::CCriteriaLatLon::Intersect (CLatLonRect & clip, CLatLonRect & intersect)

Create the intersection of this LatLon Criteria with the given one

Parameters

<i>clip</i>	intersect with this
<i>intersection</i>	

Returns

true, or false if there is no intersection

8.25.3.11 bool bratl::CCriteriaLatLon::IsDefaultValue () [virtual]

Tests whether date period have been initialized or not

Returns

true if not initialized

Implements **bratl::CCriteria** (p. 141).

8.25.3.12 void bratl::CCriteriaLatLon::Set (CLatLonRect & latLonRect)

Setter of the property `latLonRect`

Parameters

<i>latLonRect</i>	The latLonRect to set.
-------------------	------------------------

8.25.3.13 void brathl::CCriteriaLatLon::Set (CLatLonPoint & *p1*, double *deltaLat*, double *deltaLon*)

Set a lat/lon bounding box from a point, and a delta lat, lon. This disambiguates which way the box wraps around the globe.

Parameters

<i>p1</i>	one corner of the box
<i>deltaLat</i>	delta lat from p1. (may be positive or negative)
<i>deltaLon</i>	delta lon from p1. (may be positive or negative)

8.25.3.14 void brathl::CCriteriaLatLon::Set (CLatLonPoint & *latLonLow*, CLatLonPoint & *latLonHigh*)

Setter of the property `latLonRect`;

Parameters

<i>latLonLow</i>	lat/lon low point
<i>latLonHigh</i>	lat/lon high point .property name="latLonRect"

8.25.3.15 void brathl::CCriteriaLatLon::Set (double *latLow*, double *lonLow*, double *latHigh*, double *lonHigh*)

Setter of the property `latLonRect`;

Parameters

<i>latLow</i>	latitude low
<i>lonLow</i>	longitude low
<i>latHigh</i>	latitude high
<i>lonHigh</i>	longitude high

8.25.3.16 void brathl::CCriteriaLatLon::Set (const std::string & *latLow*, const std::string & *lonLow*, const std::string & *latHigh*, const std::string & *lonHigh*)

Setter of the property `latLonRect`;

Parameters

<i>latLow</i>	latitude low
<i>lonLow</i>	longitude low
<i>latHigh</i>	latitude high
<i>lonHigh</i>	longitude high

8.25.3.17 void brathl::CCriteriaLatLon::Set (const std::string & *latLonRect*, const std::string & *delimiter* = CLatLonRect::m_delimiter)

Setter of the property `latLonRect`;

Parameters

<i>latLonRect</i>	latitude low, longitude low, latitude high, longitude high
-------------------	--

8.25.3.18 void brathl::CCriteriaLatLon::SetDefaultValue () [virtual]

Sets internal value to the default value (uninitialized)

Implements **brathl::CCriteria** (p. 141).

8.25.4 Member Data Documentation

8.25.4.1 CLatLonRect bratl::CCriteriaLatLon::m_latLonRect [protected]

Bounding box for latitude/longitude points. This is a rectangle in lat/lon coordinates. Note that LatLonPoint always has lon in the range +/-180. *

The documentation for this class was generated from the following files:

- CCriteriaLatLon.h
- CCriteriaLatLon.cpp

Version

1.0

8.33.2 Member Function Documentation

8.33.2.1 void brathl::CDataSet::Dump (std::ostream & *fOut* = std::cerr) [virtual]

Dump fonction.

Copy a new **CDataSet** (p. 174) to the object

Referenced by EraseFieldSet(), and InsertFieldSet().

8.33.2.2 void brathl::CDataSet::EraseFieldSet (const std::string & *fieldSetKey*)

remove a fieldset object (identify by its name) from the current recordset

Parameters

<i>fieldSetKey</i>	[in] : fieldset key
--------------------	---------------------

References Dump(), brathl::CObMap::Erase(), and brathl::CTools::Format().

8.33.2.3 CFieldSet * brathl::CDataSet::GetFieldSet (const std::string & *fieldSetKey*)

Gets the fieldset object (identify by its name) of the current recordset

Parameters

<i>fieldSetKey</i>	[in] : fieldset key to be searched
--------------------	------------------------------------

Returns

a pointer to the fieldset object if found, otherwise NULL

8.33.2.4 void brathl::CDataSet::InsertFieldSet (const std::string & *fieldSetKey*, CFieldSet * *fieldSet*)

Inserts a fieldset object (identify by its name) into the current recordset

Parameters

<i>fieldSetKey</i>	[in] : fieldset key
<i>fieldSet</i>	[in] : fieldset object to be inserted

References Dump(), brathl::CTools::Format(), and brathl::CObMap::Insert().

8.33.2.5 void brathl::CDataSet::RemoveAll () [virtual]

Remove all elements and clear the std::list

Reimplemented from **brathl::CObArray** (p. 43).

References brathl::CObMap::RemoveAll().

The documentation for this class was generated from the following files:

- Field.h
- Field.cpp

8.34 brathl::CDate Class Reference

```
#include <Date.h>
```

Public Member Functions

- **int32_t Add** (const **CDate** &d)
- **int32_t AddDays** (uint32_t days)
- **std::string AsString** (const std::string &format="", bool withMuSecond=false) const
- **CDate** ()
Constructs a date with a 1950/01/01 value.
- **CDate** (const char *strDate)
- **CDate** (const **CDate** &date)
*Constructs a date from another **CDate** (p. 176) object.*
- **CDate** (const uint32_t year, const uint32_t month=1, const uint32_t day=1, const uint32_t hour=0, const uint32_t minute=0, const uint32_t second=0, const uint32_t muSecond=0)
Constructs a date from year, month, day, hour, minute, second, microsecond.
- **CDate** (const uint32_t days, const uint32_t seconds, const uint32_t muSeconds, const **brathl_refDate** refDate=**REF19500101**)
Constructs a date from days, seconds, microseconds.
- **CDate** (const double days, const double seconds, const double muSeconds, const **brathl_refDate** refDate=**REF19500101**)
Constructs a date from days, seconds, microseconds.
- **CDate** (const double dateSeconds, **brathl_refDate** refDate=**REF19500101**)
- **CDate** (**brathl_refDate** refDate)
- **int32_t ConstructDate** (const **brathl_refDate** refDate)

- **uint32_t DayOfYear** ()
- **virtual void Dump** (std::ostream &fOut=std::cerr)
Dump fonction.
- **uint32_t GetDay** () const
Gets the day of the date.
- **uint32_t GetHour** () const
Gets the hour of the date.
- **uint32_t GetMinute** () const
Gets the minutes of the date.
- **uint32_t GetMonth** () const
Gets the month of the date.
- **uint32_t GetMuSecond** () const
Gets the microseconds of the date.
- **uint32_t GetSecond** () const
Gets the seconds of the date.
- **uint32_t GetYear** () const
Gets the year of the date.

- uint32_t **HowManyLeapYear** (const uint32_t year) const
- void **InitDateZero** ()
- bool **IsDefaultValue** () const
- bool **IsLeapYear** ()
- int32_t **LeapYearIndex** ()
- double **operator+** (CDate &d)
- double **operator-** (CDate &d)
- const CDate & **operator=** (const CDate &date)
- const CDate & **operator=** (const char *strDate)
- const CDate & **operator=** (double seconds)
- const CDate & **operator=** (const brathl_refDate refDate)
- int32_t **SetDate** (const char *strDate)
- int32_t **SetDate** (const brathl_DateYMDHMSM &date)

8.34.1 Detailed Description

Date management and conversion class.

This class allows calendar an date conversion.

Warning

Date before 1950/01/01 00:00:00:00 are not accepted

Version

1.0

8.34.2 Constructor & Destructor Documentation

8.34.2.1 brathl::CDate::CDate (const char * *strDate*)

Constructs a date from a std::string

Parameters

<i>strDate</i>	: Allowed format are : <ul style="list-style-type: none"> • YYYY-MM-DD HH:MN:SS.MS std::string • a julian std::string (format:positive 'Days Seconds Microseconds' or positive decimal julian day)
----------------	--

8.34.2.2 brathl::CDate::CDate (const double *dateSeconds*, brathl_refDate *refDate* = REF19500101)

Constructs a date value from a decimal number of seconds

Parameters

<i>dateSeconds</i>	[in]: decimal number of seconds
<i>refDate</i>	[in]: date reference (default value is REF19500101 - see brathl_refDate (p. 341))

8.34.3 Member Function Documentation

8.34.3.1 `int32_t brathl::CDate::Add (const CDate & d)`

Adds a date to the date object

Parameters

<i>d</i>	[in]: a CDate (p. 176) object to add
----------	---

Returns

#BRATHL_SUCCESS or error code (see `Date_error_codes`)

8.34.3.2 `int32_t brathl::CDate::AddDays (uint32_t days)`

Adds a number of day to the date object

Parameters

<i>days</i>	[in]: number of days to add (if < 0, a subtract operation is performed)
-------------	---

Returns

#BRATHL_SUCCESS or error code (see `Date_error_codes`)

References `m_minutesInDay`.

8.34.3.3 `std::string brathl::CDate::AsString (const std::string & format = " ", bool withMuSecond = false) const`

Formats a date as `std::string`.

Parameters

<i>Format</i>	[in] : String controlling how the date will be converted into std::string. This format std::string consists of zero or more conversion specifications and ordinary characters. A conversion specification consists of a " (percent) character and one or two terminating conversion characters that determine the conversion specification's behavior. All ordinary characters are copied unchanged into the result. Each conversion specification is replaced by appropriate characters as described in the following list. The appropriate characters are determined by the LC_TIME category of the program's locale. %% Same as %. a Locale's abbreviated weekday name. A Locale's full weekday name. b Locale's abbreviated month name. B Locale's full month name. c Locale's appropriate date and time representation. C Century number (the year divided by 100 and truncated to an integer as a decimal number [1,99]); single digits are preceded by 0; see standards(5). d Day of month [1,31]; single digits are preceded by 0. H Hour (24-hour clock) [0,23]; single digits are preceded by 0. I Hour (12-hour clock) [1,12]; single digits are preceded by 0. j Day number of year [1,366]; single digits are preceded by 0. m Month number [1,12]; single digits are preceded by 0. M Minute [00,59]; leading 0 is permitted but not required. p Locale's equivalent of either a.m. or p.m. S Seconds [00,61]; the range of values is [00,61] rather than [00,59] to allow for the occasional leap second and even more occasional double leap second. U Week number of year as a decimal number [00,53], with Sunday as the first day of week 1. w Weekday as a decimal number [0,6], with 0 representing Sunday. W Week number of year as a decimal number [00,53], with Monday as the first day of week 1. x Locale's appropriate date representation. X Locale's appropriate time representation. y Year within century [00,99]. Y Year, including the century (for example 1993). Z Time zone name or abbreviation, or no bytes if no time zone information exists. If the format is an empty std::string it is forced to be "%Y-%m-%d %H:%M:%S" (ISO 8601)
<i>withMuSecond</i>	[in] : add the microseconds of the date at the end of the std::string (format "%.06u")

Returns

Formatted std::string

References brathl::CTools::Format().

8.34.3.4 `int32_t brathl::CDate::CheckDate (const uint32_t year, const uint32_t month = 1, const uint32_t day = 1, const uint32_t hour = 0, const uint32_t minute = 0, const uint32_t second = 0, const uint32_t muSecond = 0) [static]`

Check if a date value (year, month, day, hour, minute, second, microsecond) is valid

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

8.34.3.5 `int32_t brathl::CDate::CheckDay (uint32_t day, uint32_t month, uint32_t year) [static]`

Checks if a day value is valid, according to a month an a year

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

8.34.3.6 `int32_t brathl::CDate::CheckHour (uint32_t hour) [static]`

Checks if an hour value is valid

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

8.34.3.7 `int32_t brathl::CDate::CheckMinute (uint32_t minute) [static]`

Checks if a minute is valid

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

8.34.3.8 `int32_t brathl::CDate::CheckMonth (uint32_t month) [static]`

Checks if a month value is valid

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

Referenced by DayOfYear().

8.34.3.9 `int32_t brathl::CDate::CheckMuSecond (uint32_t muSecond) [static]`

Checks if a month value is valid

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

8.34.3.10 `int32_t brathl::CDate::CheckSecond (uint32_t second) [static]`

Checks if a second value is valid

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

8.34.3.11 `int32_t brathl::CDate::CheckYear (uint32_t year) [static]`

Checks if a year value is valid year have to be >= internal reference year (1950)

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References m_internalRefYear.

Referenced by DayOfYear().

8.34.3.12 `int32_t brathl::CDate::ConstructDate (const brathl_refDate refDate)`

Converts a date whose value corresponds to the date reference enumeration

Parameters

<i>refDate</i>	[in]: date reference - see brathl_refDate (p. 341))
----------------	--

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References brathl_refDateUser1, brathl_refDateUser2, REF19500101, REF19580101, REF19850101, REF19900101, REF20000101, REFUSER1, and REFUSER2.

8.34.3.13 `int32_t brathl::CDate::Convert2DecimalJulian (double & julian, const brathl_refDate refDate = REF19500101) const`

Converts the date value into a decimal julian day

Parameters

<i>julian</i>	[out]: decimal julian day (can be < 0)
<i>refDate</i>	[in]: date reference (default value is REF19500101 - see brathl_refDate (p. 341))

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References m_secInDay.

Referenced by brathl_DSM2Julian(), brathl_Seconds2Julian(), and brathl_YMDHMSM2Julian().

8.34.3.14 `int32_t brathl::CDate::Convert2DMM (int32_t & days, int32_t & milliSeconds, int32_t & muSeconds, const brathl_refDate refDate = REF19500101)`

Converts the date value into a number of days, milliseconds, microseconds

Parameters

<i>days</i>	[out]: number of days (can be < 0)
<i>milliSeconds</i>	[out]: number of milliseconds
<i>muSeconds</i>	[out]: number of microseconds
<i>refDate</i>	[in]: date reference (default value is REF19500101 - see brathl_refDate (p. 341))

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References m_minutesInDay, m_secInDay, and m_secInMinute.

8.34.3.15 `int32_t brathl::CDate::Convert2DMM (double & days, double & milliSeconds, double & muSeconds, const brathl_refDate refDate = REF19500101)`

Converts the date value into a number of days, milliseconds, microseconds

Parameters

<i>days</i>	[out]: number of days (can be < 0)
<i>milliSeconds</i>	[out]: number of milliseconds
<i>muSeconds</i>	[out]: number of microseconds
<i>refDate</i>	[in]: date reference (default value is REF19500101 - see brathl_refDate (p. 341))

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

8.34.3.16 `int32_t brathl::CDate::Convert2DSM (int32_t & days, int32_t & seconds, int32_t & muSeconds, const brathl_refDate refDate = REF19500101) const`

Converts the date value into a number of days, seconds, microseconds

Parameters

<i>days</i>	[out]: number of days (can be < 0)
<i>seconds</i>	[out]: number of seconds
<i>muSeconds</i>	[out]: number of microseconds
<i>refDate</i>	[in]: date reference (default value is REF19500101 - see brathl_refDate (p. 341))

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References m_minutesInDay, m_secInDay, and m_secInMinute.

Referenced by brathl_Julian2DSM(), brathl_Seconds2DSM(), and brathl_YMDHMSM2DSM().

8.34.3.17 `int32_t brathl::CDate::Convert2DSM (double & days, double & seconds, double & muSeconds, const brathl_refDate refDate = REF19500101) const`

Converts the date value into a number of days, seconds, microseconds

Parameters

<i>days</i>	[out]: number of days (can be < 0)
<i>seconds</i>	[out]: number of seconds
<i>muSeconds</i>	[out]: number of microseconds
<i>refDate</i>	[in]: date reference (default value is REF19500101 - see brathl_refDate (p. 341))

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

8.34.3.18 `int32_t brathl::CDate::Convert2Second (double & seconds, const brathl_refDate refDate = REF19500101)`

Converts the date value into a decimal number of seconds

Parameters

<i>seconds</i>	[out]: decimal number of seconds day (can be < 0)
<i>refDate</i>	[in]: date reference (default value is REF19500101 - see brathl_refDate (p. 341))

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References Value().

Referenced by brathl_DSM2Seconds(), brathl_Julian2Seconds(), and brathl_YMDHMSM2Seconds().

8.34.3.19 `int32_t brathl::CDate::Convert2SM (int32_t & seconds, int32_t & muSeconds, const brathl_refDate refDate = REF19500101)`

Converts the date value into a number of seconds, microseconds

Parameters

<i>seconds</i>	[out]: number of milliseconds (can be < 0)
<i>muSeconds</i>	[out]: number of microseconds
<i>refDate</i>	[in]: date reference (default value is REF19500101 - see brathl_refDate (p. 341))

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References m_secInMinute.

8.34.3.20 `int32_t brathl::CDate::Convert2SM (double & seconds, double & muSeconds, const brathl_refDate refDate = REF19500101)`

Converts the date value into a number of seconds, microseconds

Parameters

<i>seconds</i>	[out]: number of milliseconds (can be < 0)
<i>muSeconds</i>	[out]: number of microseconds
<i>refDate</i>	[in]: date reference (default value is REF19500101 - see brathl_refDate (p. 341))

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

8.34.3.21 `int32_t brathl::CDate::Convert2YMDHMSM (uint32_t & year, uint32_t & month, uint32_t & day, uint32_t & hour, uint32_t & minute, uint32_t & second, uint32_t & muSecond) const`

Converts the date value into year, month, day, hour, minute, second, microsecond

Parameters

<i>year</i>	[out]: year
<i>month</i>	[out]: month
<i>day</i>	[out]: day
<i>hour</i>	[out]: hour
<i>minute</i>	[out]: minute
<i>second</i>	[out]: second
<i>muSecond</i>	[out]: microsecond

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References m_daysOfYear, m_internalRefYear, m_minutesInDay, and m_minutesInHour.

Referenced by `brathl_Cycle2YMDHMSM()`, `brathl_DSM2YMDHMSM()`, `brathl_Julian2YMDHMSM()`, `brathl_NowYMDHMSM()`, and `brathl_Seconds2YMDHMSM()`.

8.34.3.22 `double brathl::CDate::CvDate (const char * strDate) [static]`

Convert a date std::string to a number of seconds since internal reference year (ie 1950) Allowed format are :

- YYYY-MM-DD HH:MM:SS.MS std::string
- a julian std::string (format:positive 'Days Seconds Microseconds' or positive decimal julian day) For julian std::string, it can contain its date reference at the end by specifying where YYYY the reference year. If no date reference is specified the default date reference is used.

Parameters

<i>strDate</i>	: date std::string
----------------	--------------------

Returns

number of seconds since internal reference year (ie 1950)

References brathl::CTools::Format(), SetDate(), and Value().

8.34.3.23 `uint32_t brathl::CDate::DayOfYear (uint32_t year, uint32_t month, uint32_t day) [static]`

Retrieves the day of a year if year is not valid, methods force the value to the internal reference year (1950) if month is not valid, methods force the value to 1 day value is not check

Parameters

<i>year</i>	[in]: year
<i>month</i>	[in]: month of year
<i>day</i>	[in]: day of the month

Returns

the day of year

References CheckMonth(), CheckYear(), LeapYearIndex(), m_daysOfYear, and m_internalRefYear.

Referenced by brathl_DayOfYear().

8.34.3.24 `uint32_t brathl::CDate::DayOfYear (CDate & date) [static]`

Retrieves the day of year of a **CDate** (p. 176) object

Parameters

<i>date</i>	[in]: date
-------------	------------

Returns

the day of year

References GetDay(), GetMonth(), LeapYearIndex(), and m_daysOfYear.

8.34.3.25 `uint32_t brathl::CDate::DayOfYear ()`

Retrieves the day of year of the date object

Returns

the day of year

8.34.3.26 `int32_t brathl::CDate::GetDateRef (const CDate & date, brathl_refDate & refDate) [static]`

Construct a date reference enumeration according to a **CDate** (p. 176) object Only date according to **brathl_refDate** (p. 341) enumeration are valid, furthermore REFUSER1 and REFUSER2 are not allowed.

Parameters

<i>date</i>	[int] : CDate (p. 176) object whose value corresponds to the refDate parameter
<i>refDate</i>	[out]: date reference enumeration value (see brathl_refDate (p. 341))

Returns

#BRATHL_SUCCESS if **CDate** (p. 176) object is according to **brathl_refDate** (p. 341) enumeration except REFUSER1 and REFUSER2. Otherwise returns a error code (see Date_error_codes)

References GetYear(), REF19500101, REF19580101, REF19850101, REF19900101, and REF20000101.

8.34.3.27 `int32_t brathl::CDate::GetDaysInMonth (const uint32_t month, const uint32_t year, uint32_t & nbDaysInMonth)`
[static]

Retrieves the number of days in a month, according to a year and a month

Parameters

<i>month</i>	[in] : month
<i>year</i>	[in] : year
<i>nbDaysInMonth[out]</i>	: number of days in the month

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

8.34.3.28 `uint32_t brathl::CDate::HowManyLeapYear (const uint32_t year) const`

Computes the number of leap years since a year

Parameters

<i>year</i>	[in]: year
-------------	------------

Returns

number of leap years

References IsLeapYear(), and m_internalRefYear.

8.34.3.29 `void brathl::CDate::InitDateZero ()`

Initializes a **CDate** (p. 176) object to 0

8.34.3.30 `bool brathl::CDate::IsDefaultValue () const`

Tests the internal value to the default value

Returns

true if default value, otherwise false

Referenced by brathl::CDatePeriod::Intersect().

8.34.3.31 `bool brathl::CDate::IsLeapYear (const uint32_t year)` [static]

Testd if the year is a leap year

Parameters

<i>year</i>	[in]: year to test
-------------	--------------------

Returns

true if the year is a leap year, otherwise false

8.34.3.32 bool brathl::CDate::IsLeapYear ()

Tests if the year of the date object is a leap year

Returns

true if the year of the date object is a leap year, otherwise false

Referenced by HowManyLeapYear(), and LeapYearIndex().

8.34.3.33 int32_t brathl::CDate::LeapYearIndex (const uint32_t year) [static]

Retrieves the index of the **m_daysOfYear** (p. 192) or **m_daysInMonth** (p. 192) arrays in accordance with the year (leap year or not)

Parameters

<i>year</i>	[in]: year to test
-------------	--------------------

Returns

0 if year is a leap year, otherwise 1

References IsLeapYear().

Referenced by DayOfYear().

8.34.3.34 int32_t brathl::CDate::LeapYearIndex ()

Retrieve sthe index of the daysOfYear or daysInMonth arrays in accordance with the year of the date object (leap year or not)

Returns

0 if year of the date object is a leap year, otherwise 1

Referenced by DayOfYear().

8.34.3.35 double brathl::CDate::operator+ (CDate & d) [inline]

Plus operator redefinition Computes the addition of two dates, the result is expressed in a decimal number of seconds

References Value().

8.34.3.36 double brathl::CDate::operator- (CDate & d) [inline]

Minus operator redefinition Computes the difference between two dates, the result is expressed in a decimal number of seconds

References Value().

8.34.3.37 bool brathl::CDate::operator< (CDate & d) [inline]

Comparison operators

References Value().

8.34.3.38 `const CDate & brathl::CDate::operator= (const CDate & date)`

Assigns a new value to the **CDate** (p. 176) object, with a **CDate** (p. 176) object

8.34.3.39 `const CDate & brathl::CDate::operator= (const char * strDate)`

Assigns a new value to the **CDate** (p. 176) object, with a date `std::string` (format: YYYY-MM-DD HH:MN:SS.MS)

8.34.3.40 `const CDate & brathl::CDate::operator= (double seconds)`

Assigns a new value to the **CDate** (p. 176) object, with a number of seconds since 1950-01-01

8.34.3.41 `const CDate & brathl::CDate::operator= (const brathl_refDate refDate)`

Assigns a new value to the **CDate** (p. 176) object, with a reference date

8.34.3.42 `int32_t brathl::CDate::SetDate (const char * strDate)`

Sets date value from a `std::string` Allowed format are :

- YYYY-MM-DD HH:MN:SS.MS `std::string`
- a julian `std::string` (format: positive 'Days Seconds Microseconds' or positive decimal julian day) For julian `std::string`, it can contain its date reference at the end by specifying where YYYY the reference year. If no date reference is specified the default date reference is used.

Parameters

<i>strDate</i>	: date <code>std::string</code>
----------------	---------------------------------

Returns

#BRATHL_SUCCESS or error code (see `Date_error_codes`)

Referenced by `brathl_DayOfYear()`, `brathl_DiffDSM()`, `brathl_DiffJulian()`, `brathl_DiffYMDHMSM()`, `brathl_DSM2-Julian()`, `brathl_DSM2Seconds()`, `brathl_DSM2YMDHMSM()`, `brathl_Julian2DSM()`, `brathl_Julian2Seconds()`, `brathl_Julian2YMDHMSM()`, `brathl_Seconds2DSM()`, `brathl_Seconds2Julian()`, `brathl_Seconds2YMDHMSM()`, `brathl_YMDHMSM2Cycle()`, `brathl_YMDHMSM2DSM()`, `brathl_YMDHMSM2Julian()`, `brathl_YMDHMSM2Seconds()`, and `CvDate()`.

8.34.3.43 `int32_t brathl::CDate::SetDate (const brathl_DateYMDHMSM & date)`

Sets date value from a **brathl_DateYMDHMSM** (p. 341) structure

Parameters

<i>date</i>	[in]: brathl_DateYMDHMSM (p. 341) structure date
-------------	---

Returns

#BRATHL_SUCCESS or error code (see `Date_error_codes`)

8.34.3.44 `int32_t brathl::CDate::SetDate (const brathl_DateDSM & date)`

Sets date value from a **brathl_DateDSM** (p. 341) structure

Parameters

<i>date</i>	[in]: brathl_DateDSM (p. 341) structure date
-------------	---

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References `_structDateDSM::days`, `_structDateDSM::muSeconds`, `_structDateDSM::refDate`, and `_structDateDSM::seconds`.

8.34.3.45 `int32_t brathl::CDate::SetDate (const uint32_t days, const uint32_t seconds, const uint32_t muSeconds, const brathl_refDate refDate = REF19500101)`

Sets date value from year, month, day, hour, minute, second, microsecond

Parameters

<i>days</i>	[in]: number of days
<i>seconds</i>	[in]: number of seconds
<i>muSeconds</i>	[in]: number of microseconds
<i>refDate</i>	[in]: date reference (default value is REF19500101 - see brathl_refDate (p. 341))

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

8.34.3.46 `int32_t brathl::CDate::SetDate (const brathl_DateSecond & date)`

Sets date value from a **brathl_DateSecond** (p. 341) structure

Parameters

<i>date</i>	[in]: brathl_DateSecond (p. 341) structure date
-------------	--

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References `_structDateSecond::nbSeconds`, and `_structDateSecond::refDate`.

8.34.3.47 `int32_t brathl::CDate::SetDate (const brathl_DateJulian & date)`

Sets date value from a **brathl_DateJulian** (p. 341) structure

Parameters

<i>date</i>	[in]: brathl_DateJulian (p. 341) structure date
-------------	--

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References `_structDateJulian::julian`, and `_structDateJulian::refDate`.

8.34.3.48 `int32_t brathl::CDate::SetDate (const uint32_t year, const uint32_t month = 1, const uint32_t day = 1, const uint32_t hour = 0, const uint32_t minute = 0, const uint32_t second = 0, const uint32_t muSecond = 0)`

Sets date value from year, month, day, hour, minute, second, microsecond

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

8.34.3.49 `int32_t brathl::CDate::SetDate (const double dateSeconds, brathl_refDate refDate = REF19500101)`

Sets date value from a decimal number of seconds

Parameters

<i>dateSeconds</i>	[in]: decimal number of seconds
<i>refDate</i>	[in]: date reference (default value is REF19500101 - see brathl_refDate (p. 341))

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References m_secInMinute.

8.34.3.50 `int32_t brathl::CDate::SetDateJulian (const double dateJulian, brathl_refDate refDate = REF19500101)`

Sets date value from a decimal julian day

Parameters

<i>dateJulian</i>	[in]: decimal julian day
<i>refDate</i>	[in]: date reference (default value is REF19500101 - see brathl_refDate (p. 341))

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References m_minutesInDay, m_secInMinute, and ValueJulian().

8.34.3.51 `int32_t brathl::CDate::SetDateNow ()`

Sets the date object to the current time

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

Referenced by brathl_NowYMDHMSM().

8.34.3.52 `void brathl::CDate::SetDefaultValue ()`

Sets internal value to the default value

8.34.3.53 `int32_t brathl::CDate::SubtractDays (uint32_t days)`

Subtracts a number of day from the date object

Parameters

<i>days</i>	[in]: number of days to subtract (if < 0, a addition operation is performed)
-------------	--

Returns

#BRATHL_SUCCESS or error code (see Date_error_codes)

References m_minutesInDay.

8.34.4 Member Data Documentation

8.34.4.1 `const uint32_t brathl::CDate::m_daysInMonth` `[static]`**Initial value:**

```
{
    {31, 29, 31, 30, 31, 30, 31, 31, 30, 31, 30, 31},
    {31, 28, 31, 30, 31, 30, 31, 31, 30, 31, 30, 31}
}
```

Array[i,j] of number of days in month i : 0 corresponds to a leap year, 1 corresponds to a non-leap year j : index of the month

8.34.4.2 `const uint32_t brathl::CDate::m_daysOfYear` `[static]`**Initial value:**

```
{
    {0, 31, 60, 91, 121, 152, 182, 213, 244, 274, 305, 335},
    {0, 31, 59, 90, 120, 151, 181, 212, 243, 273, 304, 334}
}
```

Array[i,j] of day of year i : 0 corresponds to a leap year, 1 corresponds to a non-leap year j : index of the month

Referenced by `Convert2YMDHMSM()`, and `DayOfYear()`.

8.34.4.3 `const uint32_t brathl::CDate::m_internalRefYear = 1950` `[static]`

Internal reference year (1950)

Referenced by `CheckYear()`, `Convert2YMDHMSM()`, `DayOfYear()`, and `HowManyLeapYear()`.

8.34.4.4 `const double brathl::CDate::m_minutesInDay = 1440.0` `[static]`

Number of minutes in a day

Referenced by `AddDays()`, `Convert2DMM()`, `Convert2DSM()`, `Convert2YMDHMSM()`, `SetDateJulian()`, and `SubtractDays()`.

8.34.4.5 `const double brathl::CDate::m_minutesInHour = 60.0` `[static]`

Number of minutes in an hour

Referenced by `Convert2YMDHMSM()`.

8.34.4.6 `const double brathl::CDate::m_secInDay = 86400.0` `[static]`

Number of seconds in a day

Referenced by `Convert2DecimalJulian()`, `Convert2DMM()`, and `Convert2DSM()`.

8.34.4.7 `const double brathl::CDate::m_secInHour = 3600.0` `[static]`

Number of seconds in an hour

8.34.4.8 `const double brathl::CDate::m_secInMinute = 60.0` `[static]`

Number of seconds in a minute

Referenced by `Convert2DMM()`, `Convert2DSM()`, `Convert2SM()`, `SetDate()`, and `SetDateJulian()`.

The documentation for this class was generated from the following files:

- `Date.h`
- `Date.cpp`

8.35 brathl::CDatePeriod Class Reference

```
#include <DatePeriod.h>
```

Inherits brathl::CBratObject.

Collaboration diagram for brathl::CDatePeriod:

8.35.1 Detailed Description

Date interval management class.

Version

1.0

8.35.2 Constructor & Destructor Documentation

8.35.2.1 brathl::CDatePeriod::CDatePeriod (CDatePeriod & datePeriod)

Copy constructor.

Parameters

<i>datePeriod</i>	period to set
-------------------	---------------

8.35.2.2 brathl::CDatePeriod::CDatePeriod (CDate & from, CDate & to)

Constructor.

Parameters

<i>from</i>	start date
<i>to</i>	end date

8.35.2.3 bratl::CDatePeriod::CDatePeriod (const std::string & *from*, const std::string & *to*)

Constructor.

Parameters

<i>from</i>	start date
<i>to</i>	end date

8.35.2.4 bratl::CDatePeriod::CDatePeriod (double *from*, double *to*)

Constructor.

Parameters

<i>from</i>	start date (number of seconds since 1950-01-01)
<i>to</i>	end date (number of seconds since 1950-01-01)

8.35.2.5 bratl::CDatePeriod::CDatePeriod (const CStringArray & *array*)

Constructor from a array that contains start date as std::string, end date as std::string

Parameters

<i>array</i>	start and end dates
--------------	---------------------

8.35.3 Member Function Documentation

8.35.3.1 CDate& bratl::CDatePeriod::GetFrom () [inline]

Gets start date

Returns

start date

Referenced by Intersect(), and Set().

8.35.3.2 CDate& bratl::CDatePeriod::GetTo () [inline]

Gets end date

Returns

end date

Referenced by Intersect(), and Set().

8.35.3.3 bool bratl::CDatePeriod::Intersect (CDatePeriod & *datePeriod*, CDatePeriod & *intersect*)

Create the intersection of this date period with the given one

Parameters

<i>datePeriod</i>	intersect with this
<i>intersect</i>	intersection period

Returns

true, or false if there is no intersection

References GetFrom(), and GetTo().

8.35.3.4 bool brathl::CDatePeriod::Intersect (CDate & *otherFrom*, CDate & *otherTo*, CDatePeriod & *intersect*)

Create the intersection of this date period with the given one

Parameters

<i>otherFrom</i>	start date intersect with this
<i>otherTo</i>	end date intersect with this
<i>intersect</i>	intersection period

Returns

true, or false if there is no intersection

References brathl::CDate::IsDefaultValue(), SetFrom(), and SetTo().

8.35.3.5 bool brathl::CDatePeriod::IsDefaultValue ()

Tests whether date period have been initialized or not

Returns

true if not initialized

8.35.3.6 const CDatePeriod & brathl::CDatePeriod::operator= (CDatePeriod & *datePeriod*)

Assigns a new value to the **CDatePeriod** (p. 193) object, with a **CDatePeriod** (p. 193) object

8.35.3.7 void brathl::CDatePeriod::Set (CDate & *from*, CDate & *to*)

Sets date period from start and end date

Parameters

<i>from</i>	start date
<i>to</i>	end date

8.35.3.8 void brathl::CDatePeriod::Set (const std::string & *from*, const std::string & *to*)

Sets date period from start and end date

Parameters

<i>from</i>	start date
<i>to</i>	end date

8.35.3.9 void brathl::CDatePeriod::Set (const CStringArray & *array*)

Sets a date period from a array that contains start date as std::string, end date as std::string

Parameters

<i>array</i>	start and end dates
--------------	---------------------

8.35.3.10 void brathl::CDatePeriod::Set (CDatePeriod & *datePeriod*)

Sets date period from another one

Parameters

<i>datePeriod</i>	period to set
-------------------	---------------

References GetFrom(), and GetTo().

8.35.3.11 void brathl::CDatePeriod::SetDefaultValue ()

Sets internal value to the default value (uninitialized)

8.35.3.12 void brathl::CDatePeriod::SetFrom (CDate & *from*)

Sets start date

Parameters

<i>to</i>	start date
-----------	------------

Referenced by Intersect().

8.35.3.13 void brathl::CDatePeriod::SetFrom (const std::string & *strDate*)

Sets start date

Parameters

<i>to</i>	start date
-----------	------------

References brathl::CTools::Format().

8.35.3.14 void brathl::CDatePeriod::SetTo (CDate & *to*)

Sets end date

Parameters

<i>to</i>	end date
-----------	----------

Referenced by Intersect().

8.35.3.15 void brathl::CDatePeriod::SetTo (const std::string & *strDate*)

Sets end date

Parameters

<i>to</i>	end date
-----------	----------

References brathl::CTools::Format().

8.35.4 Member Data Documentation

8.35.4.1 CDate brathl::CDatePeriod::m_from [protected]

Start date

8.35.4.2 CDate brathl::CDatePeriod::m_to [protected]

End date

The documentation for this class was generated from the following files:

8.40.1 Detailed Description

External files access.

Version

1.0

8.40.2 Member Function Documentation

8.40.2.1 void bratl::CExternalFilesAvisoGrid::LoadStructure () [protected],[virtual]

Array of the global dimension's index

Implements **bratl::CExternalFilesNetCDF** (p. 206).

The documentation for this class was generated from the following files:

- ExternalFilesAvisoGrid.h
- ExternalFilesAvisoGrid.cpp

8.41 bratl::CExternalFilesJason2 Class Reference

```
#include <ExternalFilesJason2.h>
```

Inherits bratl::CExternalFilesNetCDFCF.

Inherited by bratl::CExternalFilesJason2GDR, bratl::CExternalFilesJason2SGDR, and bratl::CExternalFilesJason2SSHA.

Public Member Functions

- **CExternalFilesJason2** (const std::string &name="")

Static Public Member Functions

- static std::string **TypeOf** ()

Static Public Attributes

- static const std::string **smMissionName** = **CTools::StringToUpper**("Jason-2")

Additional Inherited Members

8.41.1 Detailed Description

Jason-2 files access.

Version

1.0

The documentation for this class was generated from the following files:

- ExternalFilesJason2.h
- ExternalFilesJason2.cpp

8.42 brathl::CExternalFilesNetCDF Class Reference

```
#include <ExternalFilesNetCDF.h>
```

Inherits brathl::CExternalFiles.

Inherited by brathl::CExternalFilesNetCDFCF.

last error message

8.55.1 Detailed Description

File management class.

This class provides unbuffered, binary and ascii disk input/output services.

While managing the file, if an error occurred, a CFileException is raised.

Version

1.0

8.55.2 Member Enumeration Documentation

8.55.2.1 enum brathl::CFile::openFlags

File access mode enumeration: Flags can be combined by using the bitwise-OR (|) operator

Enumerator:

modeRead Opens for reading. If the file does not exist or cannot be found, open fails.

modeWrite Opens an empty file for writing. If the given file exists, its contents are destroyed.

modeAppend Opens for writing at the end of the file (appending) without removing the EOF marker before writing new data to the file; creates the file first if it doesn't exist.

modeReadWrite Opens for both reading and writing. (The file must exist.)

modeRWCreate Opens an empty file for both reading and writing. If the given file exists, its contents are destroyed.

modeReadAppend Opens for reading and appending; the appending operation includes the removal of the EOF marker before new data is written to the file and the EOF marker is restored after writing is complete; creates the file first if it doesn't exist.

typeText Open in text (translated) mode.

typeBinary Open in binary (untranslated) mode.

8.55.3 Constructor & Destructor Documentation

8.55.3.1 brathl::CFile::CFile (const std::string & name, uint32_t mode = modeRead|typeBinary)

Creates new **CFile** (p. 236) object and opens the file. If an error occurred, a CFileException is raised.

Parameters

<i>name</i>	[in] : full name of the file;
<i>mode</i>	[in] : access mode - default value : modeRead typeBinary (see openFlags (p. 238));

8.55.4 Member Function Documentation

8.55.4.1 bool brathl::CFile::Close ()

Closes file object. **IsOpen()** (p. 240) and **Open()** (p. 240) are the only functions available just after this operation.

Returns

true on success, otherwise false

Referenced by brathl::CFileParams::Load().

8.55.4.2 bool brathl::CFile::Delete ()

Closes file object and deletes (removes) the file. **IsOpen()** (p. 240) and **Open()** (p. 240) are the only functions available just after this operation.

Returns

true on success, otherwise false

8.55.4.3 bool brathl::CFile::Delete (const std::string & filename) [static]

Deletes (removes) a file.

Parameters

<i>filename</i>	[in] : file to delete/remove IsOpen() (p. 240) and Open() (p. 240) are the only functions available just after this operation.
-----------------	--

Returns

true on success, otherwise false

8.55.4.4 void brathl::CFile::Dump (std::ostream & *fOut* = std::cerr) [virtual]

Gets the las error message encountered.

Dump fonction

Reimplemented in **brathl::CFileParams** (p. 244).

8.55.4.5 bool brathl::CFile::Duplicate (const std::string & *newFileName*)

Creates a copy of current file with the newFileName. If file with specified filename exists, it's contents are erased.

Parameters

<i>newFileName</i>	[in] : copy to file name
--------------------	--------------------------

Returns

true on success, otherwise false

References IsOpen(), and WriteFromBuffer().

8.55.4.6 const std::string & brathl::CFile::GetFileName ()

Gets the name of the file

8.55.4.7 uint32_t brathl::CFile::GetMode ()

Gets the name of the file

8.55.4.8 bool brathl::CFile::GetStatus (struct stat & *fileStatus*)

Gets information about the file.

Parameters

<i>fileStatus</i>	[in] : structure to store results
-------------------	-----------------------------------

Returns

true on success, otherwise false

8.55.4.9 bool brathl::CFile::GetStatus (const std::string & *filename*, struct stat & *fileStatus*) [static]

Gets information about a file.

Parameters

<i>filename</i>	[in] : file to get the status
<i>fileStatus</i>	[in] : structure to store results

Returns

true on success, otherwise false

References Open().

8.55.4.10 bool brathl::CFile::IsOpen ()

Tests if file is opened or not

Returns

true if opened, false otherwise

Referenced by Duplicate(), and brathl::CFileParams::Load().

8.55.4.11 bool brathl::CFile::Open (const std::string & name, uint32_t mode = modeRead|typeBinary)

Opens a file. If file object is open, it is closed. If an error occurred, a CFileException is raised.

Parameters

<i>name</i>	[in] : full name of the file;
<i>mode</i>	[in] : access mode - default value : modeRead typeBinary (see openFlags (p. 238));

Returns

true on success, otherwise false

Referenced by GetStatus().

8.55.4.12 bool brathl::CFile::Open ()

Opens the current file object. If an error occurred, a CFileException is raised.

Returns

true on success, otherwise false

References brathl::CTools::Format().

Referenced by brathl::CFileParams::Load().

8.55.4.13 int32_t brathl::CFile::ReadLineData (char * lineRead, uint32_t size)

Same as #ReadLine, but reads only line of data and skip comments and places contents into buffer pointed by lineRead. Comments start with character '#' anywhere in the line. Empty line or space line are also skipped If an error occurred, a CFileException is raised.

Parameters

<i>lineRead</i>	[out] : line data read
<i>size</i>	[in] : max number of bytes of the line

Returns

the number of bytes in the lineRead parameter. -1 if end of file reached

References brathl::CTools::Trim().

Referenced by brathl::CFileParams::Load().

8.55.4.14 `int32_t brathl::CFile::ReadToBuffer (char * destinationBuffer, uint32_t numBytesToRead = CFile::m_maxBufferToRead)`

Function reads 'NumBytesToRead' bytes from the current file position and places file contents into buffer pointed by destinationBuffer. If an error occurred, a CFileException is raised.

Parameters

<i>destinationBuffer</i>	[out] : destination buffer
<i>numBytesToRead</i>	[in] : number of bytes to reads

Returns

the number of bytes actually reads, zero if end of file reached

References brathl::CTools::Format().

8.55.4.15 `bool brathl::CFile::Rename (const std::string & newName)`

Renames file object. If file with specified filename exists, its contents are erased. The current file is closed, renamed and opened as new name.

Parameters

<i>newName</i>	[in] : new file name
----------------	----------------------

Returns

true on success, otherwise false

8.55.4.16 `bool brathl::CFile::Rename (const std::string & oldName, const std::string & newName) [static]`

Renames a file. If file with specified filename exists, its contents are erased.

Parameters

<i>oldName</i>	[in] : file to rename
<i>newName</i>	[in] : new file name

Returns

true on success, otherwise false

8.55.4.17 `bool brathl::CFile::SeekToBegin ()`

Function moves file pointer to the beginning of file.

Returns

true on success, otherwise false

8.55.4.18 `bool brathl::CFile::SeekToEnd ()`

Function moves file pointer to the end of file.

Returns

true on success, otherwise false

8.55.4.19 `bool brathl::CFile::SetBufferingMode (bool mode = true)`

Change buffering mode. Function must be used before any read/write operation occurs!

Parameters

<i>mode</i>	[in] : true if buffered I/O (default), false if unbuffered I/O
-------------	--

Returns

true on success, otherwise false

8.55.4.20 `bool brathl::CFile::SetPosition (long positionOffset)`

Function moves file pointer by PositionOffset bytes relative to current position.

Parameters

<i>positionOffset</i>	[in] : offset to move
-----------------------	-----------------------

Returns

true on success, otherwise false

8.55.4.21 `bool brathl::CFile::WriteChar (const int character)`

Writes a single character to a file If an error occurred, a CFileException is raised.

Parameters

<i>character</i>	[in] : character to write
------------------	---------------------------

Returns

true on success, otherwise false

References brathl::CTools::Format().

8.55.4.22 `uint32_t brathl::CFile::WriteFromBuffer (const char * sourceBuffer, uint32_t sourceBufferLength)`

Writes data from memory to a file If an error occurred, a CFileException is raised.

Parameters

<i>sourceBuffer</i>	[in] : data to write
<i>sourceBufferLength</i>	[in] : data length to write

Returns

the number of bytes actually written.

References brathl::CTools::Format().

Referenced by Duplicate().

8.55.4.23 `bool brathl::CFile::WriteString (const char * str)`

Writes a std::string to a file If an error occurred, a CFileException is raised.

Parameters

<i>str</i>	[in] : std::string to write
------------	-----------------------------

Returns

true on success, otherwise false

References bratl::CTools::Format().

8.56.1 Detailed Description

Parameters file management class.

This class provides ascii parameters file services

It makes it possible to acquire the whole of information which they contain

Parameters are described as 'keyword'='value'

keyword is character strings identifying a type of data. value is character strings associated with the key.

keyword and value have to be on the same line;

It don't make distinction between upper-case and lower-case letters.

While managing the file, if an error occurred, a CFileException is raised. While managing parameter (keyword, value), if an error occurred, a CParameterException is raised.

Version

1.0

8.56.2 Constructor & Destructor Documentation

8.56.2.1 brathl::CFileParams::CFileParams (const std::string & name, uint32_t mode = modeRead|typeBinary)

Creates new **CFileParams** (p. 243) object and opens the parameters file. On error, a CFileException or CParameterException exception is raised.

Parameters

<i>name</i>	[in] : full name of the file;
<i>mode</i>	[in] : access mode - default value : modeRead typeBinary (see openFlags (p. 238));

References Load().

8.56.3 Member Function Documentation

8.56.3.1 unsigned brathl::CFileParams::CheckCount (const std::string & *Key*, int32_t *ValidMin* = 1, int32_t *ValidMax* = 1)

Throw an exception if the number of values is not valid.

Parameters

<i>ValidMin</i>	[in] : Minimal number of values
<i>ValidMax</i>	[in] : Maximal number of values. If <=0, it is considered as infinite. If < ValidMin, it is considered as equal to ValidMin.

Returns

actual number of occurrences of the parameter

References brathl::CParameter::Count(), brathl::CMapParameter::Exists(), brathl::CTools::Format(), and m_mapParam.

Referenced by SetVerboseLevel().

8.56.3.2 void brathl::CFileParams::Load ()

Reads file parameters and load parameters On error, a CFileException or CParameterException exception is raised.

References brathl::CFile::Close(), brathl::CFile::GetLength(), brathl::CFile::IsOpen(), m_mapParam, brathl::CFile::Open(), brathl::CFile::ReadLineData(), and brathl::CMapParameter::RemoveAll().

Referenced by CFileParams(), and Load().

8.56.3.3 void brathl::CFileParams::Load (const std::string & *name*, uint32_t *mode* = modeRead|typeBinary)

Reads file parameters and load parameters On error, a CFileException or CParameterException exception is raised.

Parameters

<i>name</i>	[in] : full name of the file;
<i>mode</i>	[in] : access mode - default value : modeRead typeBinary (see openFlags (p. 238));

References Load(), and brathl::CFile::Open().

8.56.3.4 void brathl::CFileParams::SetVerboseLevel ()

Set the verbosity level from the standard keyword VERBOSE

References CheckCount(), and m_mapParam.

8.56.4 Member Data Documentation

8.56.4.1 CMapParameter brathl::CFileParams::m_mapParam

A map containing all the parameters

Referenced by CheckCount(), Dump(), Load(), and SetVerboseLevel().

8.73.1 Detailed Description

Parameter management class.

One parameter can have 1 to n value.

This class stands for parameters

Version

1.0

8.73.2 Constructor & Destructor Documentation

8.73.2.1 brathl::CParameter::CParameter (const char * *keyword*)

Creates a new **CParameter** (p. 262) object.

Parameters

<i>keyword</i>	[in] : parameter name
----------------	-----------------------

8.73.2.2 brathl::CParameter::CParameter (const char * *keyword*, const char * *value*)

Creates a new **CParameter** (p. 262) object.

Parameters

<i>keyword</i>	[in] : parameter name
<i>value</i>	[in] : parameter value

8.73.3 Member Function Documentation

8.73.3.1 void brathl::CParameter::AddValue (const char * *value*)

Adds a value to the **CParameter** (p. 262) object.

Parameters

<i>value</i>	[in] : parameter value
--------------	------------------------

References brathl::CTools::ExpandShellVar().

Referenced by brathl::CMapParameter::Insert().

8.73.3.2 size_t brathl::CParameter::Count ()

Returns

the number of values.

Referenced by brathl::CFileParams::CheckCount().

8.73.3.3 void brathl::CParameter::GetValue (int32_t & *value*, int32_t *pos* = 0, int32_t *DefValue* = CTools::m_defaultValueINT32)

gets a **CParameter** (p. 262) object value at a given position If the list of values is empty or index pos is out of range a CParameterException is raised.

Parameters

<i>value</i>	[out] : parameter value
<i>pos</i>	[in] : position of the parameter 0.. n (default is 0, first value)

References brathl::CTools::Format(), and brathl::CTools::StrCaseCmp().

8.73.3.4 void brathl::CParameter::GetValue (char * *value*, size_t *bufferSize*, int32_t *pos* = 0, const char * *DefValue* = " ")

gets a **CParameter** (p. 262) object value at a given position If the list of values is empty or index pos is out of range a CParameterException is raised. WARNING : if size of std::string value is smaller than the size of the parameter value, data will be truncated

Parameters

<i>value</i>	[out] : parameter value
<i>bufferSize</i>	[in] : size of value
<i>pos</i>	[in] : position of the parameter 0.. n (default is 0, first value)

Returns

false if one can't get the value, otherwise true

References brathl::CTools::StrCaseCmp().

8.73.3.5 bool brathl::CParameter::RemoveAllValue ()

Removes all values.

8.73.3.6 bool brathl::CParameter::RemoveValue (uint32_t i)

Removes a value at a given position. The first value is at the index 0.

Parameters

<i>i</i>	[in] : index value to remove
----------	------------------------------

8.73.3.7 void brathl::CParameter::SetAliases (const CStringMap & aliases)

Register the formulas aliases defined.

Parameters

<i>Aliases</i>	[in] : Names/values of aliases
----------------	--------------------------------

References brathl::CTools::ExpandVariables().

The documentation for this class was generated from the following files:

- Parameter.h
- Parameter.cpp

8.76.1 Detailed Description

Envisat product management class.

Version

1.0

8.76.2 Constructor & Destructor Documentation

8.76.2.1 brathl::CProductEnvisat::CProductEnvisat (const std::string & fileName)

Creates new **CProductEnvisat** (p. 267) object

Parameters

<i>fileName</i>	[in] : file name to be connected
-----------------	----------------------------------

8.76.2.2 brathl::CProductEnvisat::CProductEnvisat (const CStringList & fileNameList, bool check_only_first_file)

Creates new **CProductEnvisat** (p. 267) object

Parameters

<i>fileNameList</i>	[in] : list of file to be connected
---------------------	-------------------------------------

8.76.3 Member Function Documentation

8.76.3.1 `virtual std::string brathl::CProductEnvisat::GetHighResolutionLatDiffFieldName () [inline], [protected], [virtual]`

Get the "High resolution latitude differences" field name

8.76.3.2 `virtual std::string brathl::CProductEnvisat::GetHighResolutionLonDiffFieldName () [inline], [protected], [virtual]`

Get the "High resolution longitude differences" field name

8.76.3.3 `bool brathl::CProductEnvisat::IsHighResolutionField (CField * field) [protected], [virtual]`

Determines if a field object is a 'high resolution' array data For Envisat, to be a 'high resolution' field, all conditions below have to be true :

- the field object is not an instance of **CFieldBasic** (p. 213)
- the field has one dimension and the dimension is 20.
- the field name is different from the '18 Hz latitude differences from 1 Hz' field (1) and the '18 Hz longitude differences from 1 Hz' field (1)
(1) if this field are present in the record. Note that only off-line product (product type RA2_GDR_2P and RA2_MWS_2P have these fields
- the field name contains 'hz18' or '18hz'

Parameters

<i>field</i>	[in] : field to be tested.
--------------	----------------------------

References brathl::CTools::StringToLower().

8.76.3.4 `virtual void brathl::CProductEnvisat::SetHighResolutionLatDiffFieldName (const std::string & value) [inline], [protected], [virtual]`

Set the "High resolution latitude differences" field name

8.76.3.5 `virtual void brathl::CProductEnvisat::SetHighResolutionLonDiffFieldName (const std::string & value) [inline], [protected], [virtual]`

Set the "High resolution longitude differences" field name

8.86.1 Detailed Description

Netcdf product management class.

Version

1.0

8.86.2 Constructor & Destructor Documentation

8.86.2.1 bratl::CProductNetCdf::CProductNetCdf (const std::string & fileName)

Creates new **CProductNetCdf** (p. 286) object

Parameters

<i>fileName</i>	[in] : file name to be connected
-----------------	----------------------------------

8.86.2.2 bratl::CProductNetCdf::CProductNetCdf (const CStringList & fileNameList, bool check_only_first_files)

Creates new **CProductNetCdf** (p. 286) object

Parameters

<i>fileNameList</i>	[in] : list of file to be connected
---------------------	-------------------------------------

8.86.3 Member Data Documentation

8.86.3.1 COBMap* bratl::CProductNetCdf::m_fieldsToRead [protected]

Map of the fields to read (key : var name → **CFieldNetCdf** (p. 217) object) NB : **CFieldNetCdf** (p. 217) objects stored in this map have not to be delete (they are not a copy !!!)

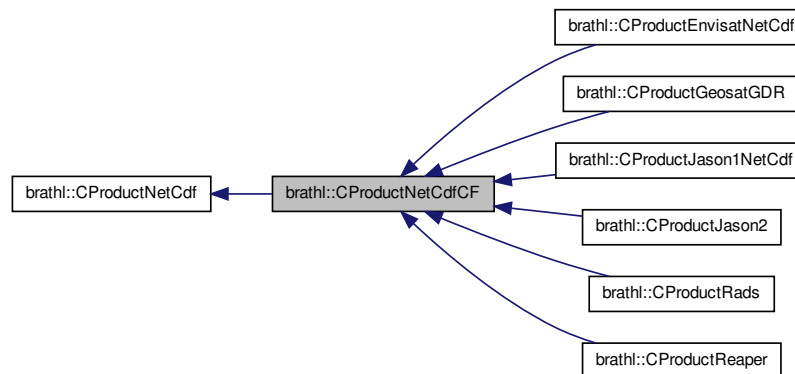

The documentation for this class was generated from the following files:

- ProductNetCdf.h
- ProductNetCdf.cpp

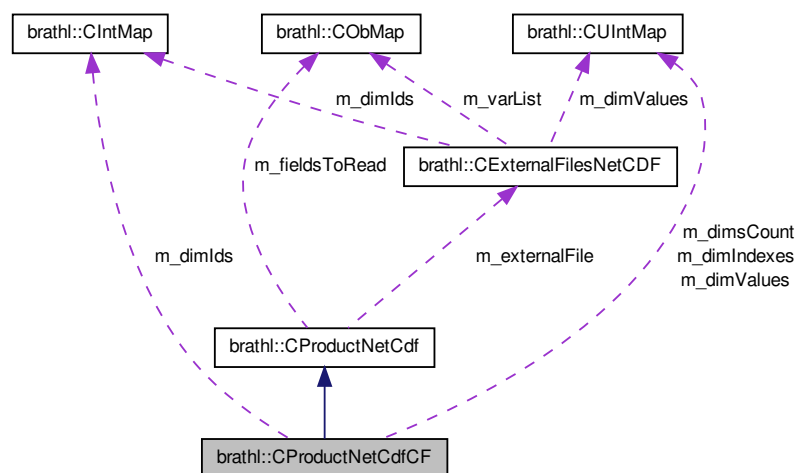

8.87 brathl::CProductNetCdfCF Class Reference

Netcdf product management class.

Version

1.0

8.87.2 Constructor & Destructor Documentation

8.87.2.1 brathl::CProductNetCdfCF::CProductNetCdfCF (const std::string & fileName)

Creates new **CProductNetCdf** (p. 286) object

Parameters

<i>fileName</i>	[in] : file name to be connected
-----------------	----------------------------------

8.87.2.2 brathl::CProductNetCdfCF::CProductNetCdfCF (const CStringList & fileNameList, bool check_only_first_file)

Creates new **CProductNetCdf** (p. 286) object

Parameters

<i>fileNameList</i>	[in] : list of file to be connected
---------------------	-------------------------------------

8.87.3 Member Data Documentation

8.87.3.1 bool brathl::CProductNetCdfCF::m_atBeginning [protected]

'At beginning" flag

Referenced by Dump().

8.87.3.2 CIntMap brathl::CProductNetCdfCF::m_dimIds [protected]

Map of the dimension's ids of the read fields (key : dim name → dim ids)

Referenced by Dump().

8.87.3.3 CUIntMap brathl::CProductNetCdfCF::m_dimsCount [protected]

Map of the dimension's ranges of the read fields (key : dim name → dim range)Array of the dimension count for reading (key : dim name → count)

Referenced by Dump().

8.87.3.4 CUIntMap brathl::CProductNetCdfCF::m_dimValues [protected]

Map of the dimension's values of the read fields (key : dim name → dim value)

Referenced by Dump().

The documentation for this class was generated from the following files:

8.92.1 Detailed Description

Topex/Poseidon product management class.

Version

1.0

8.92.2 Constructor & Destructor Documentation

8.92.2.1 bratl::CProductTopex::CProductTopex (const std::string & fileName)

Creates new **CProductTopex** (p. 298) object

Parameters

<i>fileName</i>	[in] : file name to be connected
-----------------	----------------------------------

8.92.2.2 bratl::CProductTopex::CProductTopex (const CStringList & fileNameList, bool check_only_first_file)

Creates new **CProductTopex** (p. 298) object

Parameters

<i>fileNameList</i>	[in] : list of file to be connected
---------------------	-------------------------------------

8.92.3 Member Function Documentation

8.92.3.1 bool bratl::CProductTopex::IsHighResolutionField (CField * field) [protected], [virtual]

Determines if a field object is a 'high resolution' array data For Topex/Poseidon, to be a 'high resolution' field, all conditions below have to be true :

- the field object is not an instance of **CFieldBasic** (p. 213)
- the field has one dimension and the dimension is 10.

Parameters

<i>field</i>	[in] : field to be tested.
--------------	----------------------------

Reimplemented in **bratl::CProductTopexSDR** (p. 302).

8.92.4 Member Data Documentation

8.92.4.1 const int32_t bratl::CProductTopex::m_ALTIMETER_POSEIDON = 0 [static]

Altimeter Indicator. This element is computed for TOPEX and POSEIDON data. It indicates which altimeter is on at the time of the measurement. Value Definition: 0 = POSEIDON on, 1 = TOPEX on

8.92.4.2 std::string bratl::CProductTopex::m_altimeterIndicatorFieldName [protected]

Altimeter Indicator. This element is computed for TOPEX and POSEIDON data. It indicates which altimeter is on at the time of the measurement. Value Definition: 0 = POSEIDON on, 1 = TOPEX on

The documentation for this class was generated from the following files:

8.93.3 Member Function Documentation

8.93.3.1 bool bratl::CProductTopexSDR::IsHighResolutionField (CField * *field*) [protected], [virtual]

Determines if a field object is a 'high resolution' array data For Topex/Poseidon, to be a 'high resolution' field, all conditions below have to be true :

- **CProductTopex** (p. 298) rules (see **CProductTopex::IsHighResolutionField** (p. 300))
- the field has two dimensions and the first dimension is 10 or 5.

Parameters

<i>field</i>	[in] : field to be tested.
--------------	----------------------------

Reimplemented from **brathl::CProductTopex** (p. 300).

The documentation for this class was generated from the following files:

- ProductTopexSDR.h
- ProductTopexSDR.cpp

8.94 brathl::CPtrMap Class Reference

```
#include <List.h>
```

Public Member Functions

- **CPtrMap** (bool bDelete=true)
CPtrMap (p. 303) *ctor.*
- virtual void **Dump** (std::ostream &fOut=std::cerr) const
Dump function.
- virtual bool **Erase** (CPtrMap::iterator it)
- virtual bool **Erase** (const std::string &key)
- virtual void * **Exists** (const std::string &key) const
- virtual void * **Insert** (const std::string &key, void *ptr, bool withExcept=true)
- virtual void **Insert** (const **CPtrMap** &ptrMap, bool withExcept=true)
- virtual void * **operator[]** (const std::string &key)
- virtual void **RemoveAll** ()
- virtual ~**CPtrMap** ()
CPtrMap (p. 303) *dtor.*

Protected Attributes

- bool **m_bDelete**

8.94.1 Detailed Description

a set of pointer management classes.

Version

1.0

The documentation for this class was generated from the following files:

8.100.1 Detailed Description

Tools management class.

This class provides various static utility methods

Version

1.0

8.100.2 Member Function Documentation

8.100.2.1 double brathl::CTools::Abs (double X) [static]

Find the absolute value of a number. Takes default values into account

Parameters

in	X	: Number involved
----	---	-------------------

Returns

Result of operation

8.100.2.2 `std::string brathl::CTools::AbsolutePath (const std::string & partialPath) [static]`

Creates an absolute or full path name for the specified relative path name.

- change path separator in a suitable path separator ('\' or '/' depending on the system)
- skip trailing "../", if any
- remove back references: translate dir1/../dir2 to dir2

Parameters

in	<i>partialPath</i>	: the relative path
----	--------------------	---------------------

Returns

the absolute path name, or empty `std::string` if there is an error (for example, if the value passed in `relPath` includes a drive letter that is not valid or cannot be found, or if the length of the created absolute path name is greater than the `BRATHL_PATH_MAX` defined in **brathl.h** (p. 339))

8.100.2.3 `double brathl::CTools::ACos (double X) [static]`

Do the arc cosine of a number expressed in radians. Takes default values into account

Parameters

in	<i>X</i>	: Number involved
----	----------	-------------------

Returns

Result of operation

Referenced by `ACosD()`.

8.100.2.4 `double brathl::CTools::ACosD (double X) [static]`

Do the arc cosine of a number expressed in degrees. Takes default values into account

Parameters

in	<i>X</i>	: Number involved
----	----------	-------------------

Returns

Result of operation

References `ACos()`.

8.100.2.5 `double brathl::CTools::And (double X, double Y) [static]`

Do a logical and on two numbers. Takes default values into account

Parameters

in	<i>X</i>	: Number involved
in	<i>Y</i>	: Number involved

Returns

Result of operation

8.100.2.6 double brathl::CTools::BitwiseAnd (double *X*, double *Y*) [static]

Do a bitwise AND operation an integer. The numbers are taken as signed integers (int32_t). Then a bitwise AND is computed and the integer is converted back to a float. If the parameters are default values or do not fall in integer range, a default value is returned.

Parameters

in	<i>X</i>	: Number involved
in	<i>Y</i>	: Number involved

Returns

Result of operation

8.100.2.7 double brathl::CTools::BitwiseNot (double *X*) [static]

Complement an integer. The number is taken as a signed integer (int32_t). Then a bitwise not is computed and the integer is converted back to a float. If the parameter is a default values or do not fall in integer range, a default value is returned.

Parameters

in	<i>X</i>	: Number involved
----	----------	-------------------

Returns

Complemented number

8.100.2.8 double brathl::CTools::BitwiseOr (double *X*, double *Y*) [static]

Do a bitwise OR operation an integer. The numbers are taken as signed integers (int32_t). Then a bitwise OR is computed and the integer is converted back to a float. If the parameters are default values or do not fall in integer range, a default value is returned.

Parameters

in	<i>X</i>	: Number involved
in	<i>Y</i>	: Number involved

Returns

Result of operation

8.100.2.9 double brathl::CTools::Ceil (double *X*) [static]

Find the integral value part over of a number. Takes default values into account

Parameters

in	<i>X</i>	: Number involved
----	----------	-------------------

Returns

Result of operation

8.100.2.10 double brathl::CTools::Cos (double *X*) [static]

Do the cosine of a number expressed in radians. Takes default values into account

Parameters

in	<i>X</i>	: Number involved
----	----------	-------------------

Returns

Result of operation

8.100.2.11 double brathl::CTools::CosD (double *X*) [static]

Do the cosine of a number expressed in degrees. Takes default values into account

Parameters

in	<i>X</i>	: Number involved
----	----------	-------------------

Returns

Result of operation

8.100.2.12 double brathl::CTools::Deg2Rad (double *X*) [static]

Convert degrees to radians. Takes default values into account

Parameters

in	<i>X</i>	: Number involved
----	----------	-------------------

Returns

Result of operation

Referenced by TanD().

8.100.2.13 bool brathl::CTools::DirectoryExists (const std::string & *Name*) [static]

Indicates if a directory exists

Parameters

in	<i>Name</i>	: Directory name
----	-------------	------------------

Returns

Returns true if directory exists

8.100.2.14 double brathl::CTools::Divide (double *X*, double *Y*) [static]

Divide two numbers. Takes default values into account

Parameters

in	X	: Number involved
in	Y	: Number involved

Returns

Result of operation

8.100.2.15 void brathl::CTools::DoIncrementalStats (double *NewValue*, double & *Count*, double & *Mean*, double & *StdDev*, double & *Min*, double & *Max*) [static]

Do incremental statistics. Incremental statistics are done to avoid memory consumption needed when we do 'classical' stats: an array of all the values involved with statistics must be kept before computing them. After first call to this the parameters must not be modified until end of statistics or result will be unpredictable.

Parameters

in	<i>NewValue</i>	: New value to take into account for statistics. Only valid values are kept; valid values are those different from default value (#IsDefaultValue#)
	<i>in/out</i>	Count : number of valid data used for stats. Valid data is a number which is not a default value. On first call, this parameter must be 0 or a default value. And it is not modified since the first valid value.
	<i>in/out</i>	Mean : Incremental mean
	<i>in/out</i>	StdDev : Temporary value used to compute standard deviation
	<i>in/out</i>	Min : Minimum value
	<i>in/out</i>	Max : Maximum value

8.100.2.16 std::string brathl::CTools::DoubleToStr (double *d*, int32_t *precision* = 10) [static]

Convert an double to std::string

Parameters

in	<i>value</i>	: double to be converted
----	--------------	--------------------------

Returns

coanverted value or empty std::string if no possible conversion.

8.100.2.17 double brathl::CTools::Exp (double *X*) [static]

Find exponential of a number. Takes default values into account

Parameters

in	X	: Number involved
----	---	-------------------

Returns

Result of operation

References IsInf().

8.100.2.18 std::string brathl::CTools::ExpandShellVar (const std::string & *value*) [static]

Expands shell variables (i.e. \${HOME}). If the '\$' character is preceded by '\', it's taken into account as a common character and not as a shell variable identifier. Shell variables beginning by '+' are expanded in uppercase. Shell variables beginning by '-' are expanded in lowercase.

Parameters

<i>in</i>	<i>value</i>	: The std::string to expand
-----------	--------------	-----------------------------

Returns

the newly expanded std::string.

References ExpandVariables().

Referenced by brathl::CParameter::AddValue().

8.100.2.19 `std::string brathl::CTools::ExpandVariables (const std::string & valueIn, const std::map< std::string, std::string > * varValues, bool recurse = false, char beginning = ' % ', uint32_t * numberVarsExpanded = NULL, bool withExcept = false, std::string * errorMsg = NULL) [static]`

Expand variables (i.e. %{VAR}). If the " character is preceded by '\', it's taken into account as a common character and not as a variable identifier. Variables beginning by '+' are expanded in uppercase. Variables beginning by '-' are expanded in lowercase.

Parameters

<i>in</i>	<i>value</i>	: The std::string to expand
<i>in</i>	<i>VarValues</i>	: The values of the variables. If NULL, the environment variables are taken.
<i>in</i>	<i>Beginning</i>	: Char identifying the beginning of a var reference
<i>in</i>	<i>Recurse</i>	: If true, variable expanded can contain references to other variables which are then expanded.

Returns

the newly expanded std::string.

Referenced by ExpandShellVar(), and brathl::CParameter::SetAliases().

8.100.2.20 `bool brathl::CTools::FileExists (const std::string & Name) [static]`

Indicates if a file exists

Parameters

<i>in</i>	<i>Name</i>	: File name
-----------	-------------	-------------

Returns

Returns true if file exists and is readable

8.100.2.21 `std::string brathl::CTools::FileExtension (const std::string & fileName) [static]`

Gets a file name extension.

Parameters

<i>in</i>	<i>filename</i>	: file name
-----------	-----------------	-------------

Returns

the extension, or empty std::string if none

8.100.2.22 void brathl::CTools::FinalizeIncrementalStats (double *Count*, double & *Mean*, double & *StdDev*, double & *Min*, double & *Max*, double *DefaultValue* = m_defaultValueDOUBLE) [static]

Terminates incremental statistics. Computes the final value of standard deviation

Parameters

in	<i>Count</i>	: number of valid data used for stats. If count is 0 or default value, all other output parameters are set to default value.
	<i>in/out</i>	Mean : Computed mean or default value (see Count)
	<i>in/out</i>	StdDev : On output, actual value of standard deviation
	<i>in/out</i>	Min : Computed min or default value (see Count)
	<i>in/out</i>	Max : Computed max or default value (see Count)
in	<i>DefaultValue</i>	: Default value wanted Value to put in output parameters if no stats can be done (no valid data: count is 0 or default value m_defaultValueDOUBLE (p. 312)#).

8.100.2.23 std::string brathl::CTools::FindDataFile (const std::string & *Name*) [static]

Finds a file path known only by its name. The path is retrieved from compilation (intallation prefix) or by environment variable.

Parameters

in	<i>Name</i>	: File name
----	-------------	-------------

Returns

Returns the path of found file or an empty std::string if not found

8.100.2.24 std::string brathl::CTools::FindFileInPath (const std::string & *filename*, const std::string & *path*) [static]

Finds a file location known only by its name using the give path. The path should be similar to what can be used for the PATH environment variable on the current system.

Parameters

in	<i>filename</i>	: File name
in	<i>path</i>	: Search path

Returns

Returns the full path to the file or an empty std::string if not found

8.100.2.25 double brathl::CTools::Floor (double *X*) [static]

Find the integral value part below of a number. Takes default values into account

Parameters

in	<i>X</i>	: Number involved
----	----------	-------------------

Returns

Result of operation

8.100.2.26 std::string bratl::CTools::Format (size_t size, const char * format, ...) [static]

Write formatted data to a std::string. WARNING : this method use vsnprintf if vsnprintf is defined, otherwise vsprintf is used and 'size' parameter is ignored

Parameters

in	size	: maximum number of characters to store
in	format	: format-control std::string
in	...	: optional arguments

Returns

formatted std::string

Referenced by bratl::CDate::AsString(), bratl::BuildExistingInternalFileKind(), bratl::CFileParams::CheckCount(), bratl::CDate::CvDate(), bratl::CDoubleMap::Dump(), bratl::CObDoubleMap::Dump(), bratl::CDoublePtrDoubleMap::Dump(), bratl::CDataSet::EraseFieldSet(), bratl::CBratAlgorithmGeosVelGrid::GetInputParamDesc(), bratl::CBratAlgorithmGeosVelAtp::GetInputParamDesc(), bratl::CBratAlgoFilterMedian1D::GetInputParamDesc(), bratl::CBratAlgoFilterLoess1D::GetInputParamDesc(), bratl::CBratAlgoFilterLoess2D::GetInputParamDesc(), bratl::CBratAlgoFilterMedian2D::GetInputParamDesc(), bratl::CBratAlgorithmGeosVelGrid::GetInputParamFormat(), bratl::CBratAlgorithmGeosVelAtp::GetInputParamFormat(), bratl::CBratAlgoFilterMedian1D::GetInputParamFormat(), bratl::CBratAlgoFilterLoess2D::GetInputParamFormat(), bratl::CBratAlgoFilterLoess1D::GetInputParamFormat(), bratl::CBratAlgoFilterMedian2D::GetInputParamFormat(), bratl::CBratAlgorithmGeosVelGrid::GetInputParamUnit(), bratl::CBratAlgorithmGeosVelAtp::GetInputParamUnit(), bratl::CBratAlgoFilterMedian1D::GetInputParamUnit(), bratl::CBratAlgoFilterMedian2D::GetInputParamUnit(), bratl::CBratAlgoFilterLoess2D::GetInputParamUnit(), bratl::CBratAlgoFilterLoess1D::GetInputParamUnit(), bratl::CParameter::GetValue(), bratl::CUIntMap::Insert(), bratl::CDataSet::InsertFieldSet(), bratl::CProductErsWAP::IsHighResolutionField(), bratl::CFile::Open(), bratl::CFile::ReadToBuffer(), bratl::CBratAlgoFilterLanczos1D::Run(), bratl::CBratAlgoFilterGaussian1D::Run(), bratl::CBratAlgoFilterMedian1D::Run(), bratl::CBratAlgoFilterLoess1D::Run(), bratl::CDatePeriod::SetFrom(), bratl::CDatePeriod::SetTo(), SlashesDecode(), SlashesEncode(), bratl::CFile::WriteChar(), bratl::CFile::WriteFromBuffer(), and bratl::CFile::WriteString().

8.100.2.27 std::string bratl::CTools::Format (const char * format, ...) [static]

Write formatted data to a std::string. WARNING : this method use vsnprintf if vsnprintf is defined, otherwise vsprintf is used and 'size' parameter is ignored

Parameters

in	format	: format-control std::string
in	...	: optional arguments

Returns

formatted std::string

8.100.2.28 std::string bratl::CTools::Format (size_t size, const char * format, va_list args) [static]

Write formatted data to a std::string. WARNING : this method use vsnprintf if vsnprintf is defined, otherwise vsprintf is used and 'size' parameter is ignored

Parameters

in	<i>size</i>	: maximum number of characters to store
in	<i>format</i>	: format-control std::string
in	<i>args</i>	: optional arguments

Returns

formatted std::string

8.100.2.29 std::string brathl::CTools::GetInternalDataDir () [static]

Returns the constant data directory defined at compilation time, by environment variable, or set by application.

Returns

Returns the path of found file or an empty std::string if not found

8.100.2.30 std::string brathl::CTools::IntToStr (int32_t i) [static]

Convert an int to std::string

Parameters

in	<i>value</i>	: int to be converted
----	--------------	-----------------------

Returns

coanverted value or empty std::string if no possible conversion.

8.100.2.31 double brathl::CTools::IsBounded (double *Min*, double *X*, double *Max*) [static]

Indicates if a number is comprised between two others. Takes default values into account

Parameters

in	<i>Min</i>	: Lower bound
in	<i>X</i>	: Number involved
in	<i>Max</i>	: Upper bound

Returns

Result of operation: 0 if not $\text{Min} \leq X \leq \text{Max}$.

8.100.2.32 double brathl::CTools::IsBoundedStrict (double *Min*, double *X*, double *Max*) [static]

Indicates if a number is comprised between two others. Takes default values into account

Parameters

in	<i>Min</i>	: Lower bound
in	<i>X</i>	: Number involved
in	<i>Max</i>	: Upper bound

Returns

Result of operation: 0 if not $\text{Min} < X < \text{Max}$.

8.100.2.33 `double brathl::CTools::IsDefaultFloat (double X) [static]`

Checks a default value.

Parameters

<code>in</code>	<code>X</code>	: Number involved
-----------------	----------------	-------------------

Returns

0.0 if X is not a default value, 1.0 otherwise

8.100.2.34 `int32_t brathl::CTools::IsInf (double X) [static]`

Indicates if a number is infinite.

Parameters

<code>in</code>	<code>X</code>	: Number involved
-----------------	----------------	-------------------

Returns

0 if X is finite 1 if infinite

Referenced by `Exp()`, `Pow()`, `Sqr()`, and `Tan()`.

8.100.2.35 `int32_t brathl::CTools::IsNan (double X) [static]`

Indicates if a value is a valid number.

Parameters

<code>in</code>	<code>X</code>	: Number involved
-----------------	----------------	-------------------

Returns

0 if X is valid, 1 if X is not a number

Referenced by `Tan()`.

8.100.2.36 `double brathl::CTools::Log (double X) [static]`

Find the natural logarithm of a number. Takes default values into account

Parameters

<code>in</code>	<code>X</code>	: Number involved
-----------------	----------------	-------------------

Returns

Result of operation

8.100.2.37 `double brathl::CTools::Log10 (double X) [static]`

Find the decimal logarithm of a number. Takes default values into account

Parameters

<code>in</code>	<code>X</code>	: Number involved
-----------------	----------------	-------------------

Returns

Result of operation

8.100.2.38 `std::string bratl::CTools::MakeCorrectPath (const std::string & path) [static]`

Cleans a path variable

- change path separator in a suitable path separator ('\' or '/' depending on the system)
- skip trailing "../", if any
- remove back references: translate dir1/../dir2 to dir2

Parameters

in	<i>path</i>	: The std::string to clean
----	-------------	----------------------------

Returns

the newly cleaned std::string.

8.100.2.39 `double bratl::CTools::Max (double X1, double X2) [static]`

Find the maximum value of two numbers. Takes default values into account

Parameters

in	<i>X1</i>	: Number involved
in	<i>X2</i>	: Number involved

Returns

Result of operation

Referenced by bratl::CCriteriaLatLon::GetMinOrMaxLon().

8.100.2.40 `double bratl::CTools::Min (double X1, double X2) [static]`

Find the minimum value of two numbers. Takes default values into account

Parameters

in	<i>X1</i>	: Number involved
in	<i>X2</i>	: Number involved

Returns

Result of operation

Referenced by bratl::CCriteriaLatLon::GetMinOrMaxLon().

8.100.2.41 `double bratl::CTools::Minus (double X, double Y) [static]`

Subtracts one number from another. TAKES default values into account

Parameters

in	<i>X</i>	: Number involved
in	<i>Y</i>	: Number involved

Returns

Result of operation

8.100.2.42 double brathl::CTools::Mod (double *X*, double *Y*) [static]

Find the modulus of a number divided by another. Takes default values into account

Parameters

in	<i>X</i>	: Number involved
in	<i>Y</i>	: Divider

Returns

Result of operation

8.100.2.43 double brathl::CTools::Multiply (double *X*, double *Y*) [static]

Multiply two numbers. Takes default values into account

Parameters

in	<i>X</i>	: Number involved
in	<i>Y</i>	: Number involved

Returns

Result of operation

8.100.2.44 double brathl::CTools::NormalizeLongitude (double *Floor*, double *Longitude*) [static]

Find a number satisfying the condition $Floor \leq Longitude < Floor+360$. Takes default values into account

Parameters

in	<i>Floor</i>	: Base longitude
in	<i>Longitude</i>	: Longitude to normalize

Returns

Result of operation

8.100.2.45 double brathl::CTools::Or (double *X*, double *Y*) [static]

Do a logical or on two numbers. Takes default values into account

Parameters

in	<i>X</i>	: Number involved
in	<i>Y</i>	: Number involved

Returns

Result of operation

8.100.2.46 `double brathl::CTools::Plus (double X, double Y) [static]`

Add two numbers. Takes default values into account

Parameters

<code>in</code>	<code>X</code>	: Number involved
<code>in</code>	<code>Y</code>	: Number involved

Returns

Result of operation

8.100.2.47 `double brathl::CTools::Pow (double X, double Y) [static]`

Find the power of a number by another. Takes default values into account

Parameters

<code>in</code>	<code>X</code>	: Number involved
<code>in</code>	<code>Y</code>	: Power. Can be a integral or decimal

Returns

Result of operation

References `IsInf()`.

8.100.2.48 `double brathl::CTools::Rad2Deg (double X) [static]`

Convert radians to degrees. Takes default values into account

Parameters

<code>in</code>	<code>X</code>	: Number involved
-----------------	----------------	-------------------

Returns

Result of operation

8.100.2.49 `char * brathl::CTools::RemoveAllSpaces (char * str) [static]`

Remove all the blank characters in a `std::string`. Blank characters are identified by the function `isspace (3C)`.

Parameters

<code>str</code>	[in/out] : <code>std::string</code> to be modified
------------------	--

Returns

a pointer to the `std::string`

Referenced by `StringRemoveAllSpaces()`.

8.100.2.50 `std::string brathl::CTools::RemoveCharSurroundingNumber (const std::string & str, const char c1 = ' (', const char c2 = ') ') [static]`

Removes characters *c1* and *c2*, if these characters surround an number (integer or decimal). For example: RemoveCharSurroundingNumber("ABCD (125)", '(', ')') will return "ABCD 125" RemoveCharSurroundingNumber("ABCD (+125.63)", '(', ')') will return "ABCD +125.63" RemoveCharSurroundingNumber("ABCD (-45) (XYZ*2)", '(', ')') will return "ABCD -45 (XYZ*2)" RemoveCharSurroundingNumber("(ABCD ((-45)))", '(', ')') will return "(ABCD (-45))"

Parameters

in	<i>str</i>	: The std::string to modify
in	<i>c1</i>	: the first surrounding char
in	<i>c2</i>	: the last surrounding char

Returns

the newly modified std::string.

8.100.2.51 `void brathl::CTools::SetInternalDataDir (const std::string & DataDir) [static]`

Explicitly set the Data Directory.

Parameters

in	<i>DataDir</i>	: Full path to data directory.
----	----------------	--------------------------------

8.100.2.52 `double brathl::CTools::Sign (double X) [static]`

Find the sign of a number (1 if positive or null, -1 if negative). Takes default values into account

Parameters

in	<i>X</i>	: Number involved
----	----------	-------------------

Returns

Result of operation

8.100.2.53 `double brathl::CTools::Sin (double X) [static]`

Do the sine of a number expressed in radians. Takes default values into account

Parameters

in	<i>X</i>	: Number involved
----	----------	-------------------

Returns

Result of operation

8.100.2.54 `double brathl::CTools::SinD (double X) [static]`

Do the sine of a number expressed in degrees. Takes default values into account

Parameters

in	<i>X</i>	: Number involved
----	----------	-------------------

Returns

Result of operation

8.100.2.55 `std::string brathl::CTools::SlashesDecode (const std::string & str, const std::string & exclude = " ", bool decodeliterals = true) [static]`

Takes a std::string with escaped charters including decimal and hexadecimal escapes and decodes them to the literal charter. This function supports only standard C/C++ escaped literals.

Parameters

in	<i>str</i>	: The std::string to decode.
in	<i>exclude</i>	: A list of charters to exclude from decoding.
in	<i>decodeliterals</i>	: Set if non standard escaped literals are to be decoded.

Returns

the newly encoded std::string.

References Format().

8.100.2.56 `std::string brathl::CTools::SlashesEncode (const std::string & str, const std::string & exclude = " ", const std::string & literals = " ", bool hexadecimal = true) [static]`

This encodes characters that are not printable or can be encode with one of the C/C++ standard escape sequences. The 'exclude' list is a list of chars to exclude from the encoding process. Since the '\0' is used to determine the end of the std::string and will not be encoded.

Parameters

in	<i>str</i>	: The std::string to encode.
in	<i>exclude</i>	: A list of charters to exclude from encoding.
in	<i>literals</i>	:A list of printable characters to be included in the encodeing.
	<i>hexadecimal</i>	If true, non-standard, non-printable charecters will be encoded in hexadecimal. If false they will be encoded in octal format.

Returns

the newly encoded std::string.

References Format().

8.100.2.57 `int32_t brathl::CTools::snprintf (char * str, size_t size, const char * format, ...) [static]`

Write formatted data to a std::string. WARNING : this method use vsnprintf if vsnprintf is defined, otherwise vsprintf is used and 'size' parameter is ignored

Parameters

out	<i>str</i>	: storage location for output.
in	<i>size</i>	: maximum number of characters to store
in	<i>format</i>	: format-control std::string
in	<i>...</i>	: optional arguments

Returns

return value of the vsnprintf or vsprintf - see documentation of these functions

8.100.2.58 double brathl::CTools::Sqr (double *X*) [static]

Find the square value of a number. Takes default values into account

Parameters

in	<i>X</i>	: Number involved
----	----------	-------------------

Returns

Result of operation

References IsInf().

8.100.2.59 double brathl::CTools::Sqrt (double *X*) [static]

Find the square root value of a number. Takes default values into account

Parameters

in	<i>X</i>	: Number involved
----	----------	-------------------

Returns

Result of operation

8.100.2.60 int32_t brathl::CTools::StrCaseCmp (const char * *str1*, const char * *str2*) [static]

Compare the two strings str1 and str2, while being unaware of the differences between upper-case and lower-case. This method is thus identical to the function strcasecmp (3C) with the following difference : str1, str2 can be NULL, in this case, the std::string concerned is regarded as a null std::string.

Parameters

in	<i>str1</i>	: std::string 1
in	<i>str2</i>	: std::string 2

Returns

: negative, null (= 0) or positive value if the str1 is respectively lower, equal or higher than str2.

Referenced by brathl::CParameter::GetValue().

8.100.2.61 std::string brathl::CTools::StringRemoveAllSpaces (const std::string & *str*) [static]

Remove all the blank characters in a std::string. Blank characters are identified by the function isspace (3C).

Parameters

in	<i>str</i>	: std::string to be modified
----	------------	------------------------------

Returns

the modified std::string

References RemoveAllSpaces().

8.100.2.62 std::string brathl::CTools::StringReplace (const std::string & *str*, char *c*, char *replaceBy*) [static]

Replace all tokens of char *c* by char *replaceBy* in a std::string.

Parameters

in	<i>str</i>	: std::string to be modified
in	<i>c</i>	: char to replace
in	<i>replaceBy</i>	: char replaced

Returns

the modified std::string

8.100.2.63 std::string brathl::CTools::StringReplace (const std::string & *str*, const std::string & *c*, const std::string & *replaceBy*, bool *compareNoCase* = false) [static]

Replace all tokens of std::string *c* by std::string *replaceBy* in a std::string.

Parameters

in	<i>str</i>	: std::string to be modified
in	<i>c</i>	: std::string to replace
in	<i>replaceBy</i>	: std::string replaced

Returns

the modified std::string

8.100.2.64 std::string brathl::CTools::StringToLower (const std::string & *str*) [static]

Set a std::string object in lowercase

Parameters

<i>str</i>	[in/out] : std::string to be modified
------------	---------------------------------------

Returns

a new std::string object in lowercase

References ToLower().

Referenced by brathl::CProductEnvisat::IsHighResolutionField().

8.100.2.65 std::string brathl::CTools::StringToUpper (const std::string & *str*) [static]

Set a std::string object in uppercase

Parameters

in	<i>str</i>	: character
----	------------	-------------

Returns

a new std::string object in uppercase

References ToUpper().

8.100.2.66 `std::string brathl::CTools::StringTrim (const std::string & str) [static]`

Remove all the blank characters at the beginning and the end of a std::string. Blank characters are identified by the function isspace (3C).

Parameters

<i>str</i>	[in/out] : std::string to be modified
------------	---------------------------------------

Returns

a trimmed std::string

Referenced by StrToDouble(), Trim(), UnconvertLat(), and UnconvertLon().

8.100.2.67 `double brathl::CTools::StrToDouble (const std::string & value) [static]`

Convert an std::string to double

Parameters

<i>in</i>	<i>value</i>	: std::string to be converted
-----------	--------------	-------------------------------

Returns

coconverted value or CTool::m_defaultValueDOUBLE if no possible conversion.

References StringTrim().

Referenced by UnconvertLat(), and UnconvertLon().

8.100.2.68 `int32_t brathl::CTools::StrToInt32 (const std::string & s) [static]`

Convert an std::string to int

Parameters

<i>in</i>	<i>value</i>	: std::string to be converted
-----------	--------------	-------------------------------

Returns

coconverted value or CTool::m_defaultValueINT if no possible conversion.

Referenced by brathl::CCriteriaCycle::Set(), brathl::CCriteriaPassInt::Set(), brathl::CCriteriaCycle::SetFrom(), brathl::CCriteriaPassInt::SetFrom(), brathl::CCriteriaCycle::SetTo(), and brathl::CCriteriaPassInt::SetTo().

8.100.2.69 `int64_t brathl::CTools::StrToInt64 (const std::string & s) [static]`

Convert an std::string to int64

Parameters

<i>in</i>	<i>value</i>	: std::string to be converted
-----------	--------------	-------------------------------

Returns

coanverted value or CTool::m_defaultValueINT if no possible conversion.

8.100.2.70 `uint64_t brathl::CTools::StrToUInt64 (const std::string & s) [static]`

Convert an std::string to uint64

Parameters

<i>in</i>	<i>value</i> : std::string to be converted
-----------	--

Returns

coanverted value or CTool::m_defaultValueINT if no possible conversion.

8.100.2.71 `double brathl::CTools::Tan (double X) [static]`

Do the tangent of a number expressed in radians. Takes default values into account

Parameters

<i>in</i>	<i>X</i> : Number involved
-----------	----------------------------

Returns

Result of operation

References IsInf(), and IsNan().

Referenced by TanD().

8.100.2.72 `double brathl::CTools::TanD (double X) [static]`

Do the tangent of a number expressed in degrees. Takes default values into account

Parameters

<i>in</i>	<i>X</i> : Number involved
-----------	----------------------------

Returns

Result of operation

References Deg2Rad(), and Tan().

8.100.2.73 `char * brathl::CTools::ToLower (char * str) [static]`

Set a std::string in lowercase

Parameters

<i>str</i> [in/out] : std::string to be modified
--

Returns

a pointer to the std::string

Referenced by StringToLower().

8.100.2.74 `char brathl::CTools::ToLower (const char chr) [static]`

Set a std::string in lowercase

Parameters

<i>in</i>	<i>chr</i>	: character
-----------	------------	-------------

Returns

the lowercase character

8.100.2.75 `char * brathl::CTools::ToUpper (char * str) [static]`

Set a std::string in uppercase

Parameters

<i>str</i>	[in/out] : std::string to be modified
------------	---------------------------------------

Returns

a pointer to the std::string

Referenced by StringToUpper().

8.100.2.76 `char brathl::CTools::ToUpper (const char chr) [static]`

Set a character in uppercase

Parameters

<i>in</i>	<i>chr</i>	: character
-----------	------------	-------------

Returns

the uppercase character

8.100.2.77 `std::string brathl::CTools::TrailingZeroesTrim (const std::string & Text, bool dotTrim = true) [static]`

Removes trailing zeroes from a number: 2.30000 is transformed into 2.3.

Parameters

<i>in</i>	<i>Text</i>	: String
<i>in</i>	<i>dotTrim</i>	: if true, remove dot at the end : 2.000 -> 2, if false, leave dot : 2.000 -> 2.

Returns

Returns modified std::string

8.100.2.78 `char * brathl::CTools::Trim (char * str) [static]`

Remove all the blank characters at the beginning and the end of a std::string. Blank characters are identified by the function isspace (3C).

Parameters

<i>str</i>	[in/out] : std::string to be modified
------------	---------------------------------------

Returns

a pointer to the std::string

References StringTrim().

Referenced by brathl::CFile::ReadLineData().

8.100.2.79 double brathl::CTools::UnaryMinus (double *X*) [static]

Negates a number. Takes default values into account

Parameters

<i>in</i>	<i>X</i> : Number involved
-----------	----------------------------

Returns

Negated number

8.100.2.80 double brathl::CTools::UnaryNot (double *X*) [static]

Negates a logical value (0 is false, other (except default value) is true. Takes default values into account

Parameters

<i>in</i>	<i>X</i> : Number involved
-----------	----------------------------

Returns

Negated value

8.100.2.81 double brathl::CTools::UnconvertLat (const std::string & *value*) [static]

Converts and normalize a latitude std::string representation (eg 60 N, 75.56 W, 60, -75.56) Normalize +/-90.

Parameters

<i>value</i>	latitude std::string representation
--------------	-------------------------------------

References StringTrim(), and StrToDouble().

8.100.2.82 double brathl::CTools::UnconvertLon (const std::string & *value*, bool *normalize* = true) [static]

Converts and eventually normalize a longitude std::string representation (eg 60 E, 120.23 W, 60, -120.23) Normalize +/-180.

Parameters

<i>normalize</i>	set to true to normalize longitude value
<i>value</i>	longitude std::string representation

Returns

converted longitude.

References StringTrim(), and StrToDouble().

8.102.1 Detailed Description

a set of unsigned integer value management classes.

Version

1.0

The documentation for this class was generated from the following files:

- List.h
- List.cpp

8.103 PyAlgo Class Reference

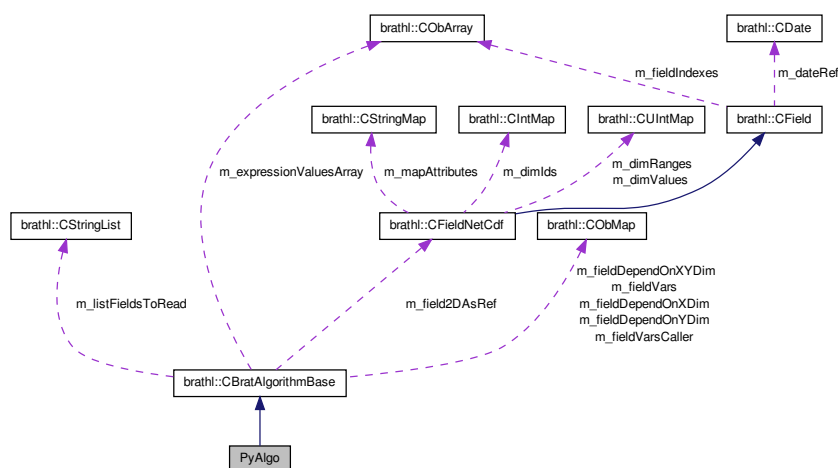

Definition of the object to hold each Python Algorithm and respective variables/methods.

```
#include <PythonEngine.hpp>
```

Inheritance diagram for PyAlgo:

Collaboration diagram for PyAlgo:

Public Member Functions

- void **CreateAlgorithmParamVector** (CVectorBratAlgorithmParam &brat_args, char **args, size_t argcount)
- virtual std::string **GetDescription** () const override
- virtual std::string **GetInputParamDesc** (uint32_t indexParam) const override
- virtual
CBratAlgorithmParam::bratAlgoParamTypeVal **GetInputParamFormat** (uint32_t indexParam) const override
- virtual std::string **GetInputParamUnit** (uint32_t indexParam) const override
- virtual std::string **GetName** () const override
- virtual uint32_t **GetNumInputParam** () const override
- virtual std::string **GetOutputUnit** () const override
- virtual std::string **GetParamName** (uint32_t indexParam) const override
- **PyAlgo** (const std::string file_path, const std::string &class_name)
User defined constructor for **PyAlgo** (p. 334).
- virtual double **Run** (CVectorBratAlgorithmParam &args) override
- virtual ~**PyAlgo** ()
Default destructor for **PyAlgo** (p. 334).

Static Protected Member Functions

- static PyObject * **createPyArguments** (CVectorBratAlgorithmParam &args)
Method to create a list of Python arguments.
- template<typename T >
static T & **processCall** (PyObject *py_result, T &result)
Method to process the result of a method call.

Additional Inherited Members

8.103.1 Detailed Description

Definition of the object to hold each Python Algorithm and respective variables/methods.

8.103.2 Constructor & Destructor Documentation

8.103.2.1 PyAlgo::PyAlgo (const std::string *file_path*, const std::string & *class_name*) [inline]

User defined constructor for **PyAlgo** (p. 334).

Parameters

in	<i>file_path</i>	The path of the algorithm python script/module.
in	<i>class_name</i>	Name of the algorithm class.

8.103.3 Member Function Documentation

8.103.3.1 static PyObject* PyAlgo::createPyArguments (CVectorBratAlgorithmParam & *args*) [inline],[static],[protected]

Method to create a list of Python arguments.

Returns

pArgs Python List with python objects/arguments.

Referenced by Run().

8.103.3.2 virtual std::string PyAlgo::GetDescription () const [inline],[override],[virtual]

Gets the description of the algorithm

Implements **brathl::CBratAlgorithmBase** (p. 125).

References processCall().

8.103.3.3 virtual std::string PyAlgo::GetInputParamDesc (uint32_t *indexParam*) const [inline],[override],[virtual]

Gets the description of an input parameter.

Parameters

<i>indexParam</i>	[in] : parameter index. First parameter index is 0, last one is 'number of parameters - 1'.
-------------------	---

Implements **brathl::CBratAlgorithmBase** (p. 125).

References processCall().

8.103.3.4 `virtual CBratAlgorithmParam::bratAlgoParamTypeVal PyAlgo::GetInputParamFormat (uint32_t indexParam) const` `[inline], [override], [virtual]`

Gets the format of an input parameter : CBratAlgorithmParam::T_DOUBLE for double CBratAlgorithmParam::T_FLOAT for float CBratAlgorithmParam::T_INT for integer CBratAlgorithmParam::T_LONG for long integer CBratAlgorithmParam::T_STRING for std::string CBratAlgorithmParam::T_CHAR for a character

Parameters

<i>indexParam</i>	[in] : parameter index. First parameter index is 0, last one is 'number of parameters - 1'.
-------------------	---

Implements **bratl::CBratAlgorithmBase** (p. 125).

References processCall().

8.103.3.5 `virtual std::string PyAlgo::GetInputParamUnit (uint32_t indexParam) const` `[inline], [override], [virtual]`

Gets the unit of an input parameter :

Parameters

<i>indexParam</i>	[in] : parameter index. First parameter index is 0, last one is 'number of parameters - 1'.
-------------------	---

Implements **bratl::CBratAlgorithmBase** (p. 125).

References processCall().

8.103.3.6 `virtual std::string PyAlgo::GetName () const` `[inline], [override], [virtual]`

Gets the name of the algorithm

Implements **bratl::CBratAlgorithmBase** (p. 125).

References processCall().

8.103.3.7 `virtual uint32_t PyAlgo::GetNumInputParam () const` `[inline], [override], [virtual]`

Gets the number of input parameters to pass to the 'Run' function

Implements **bratl::CBratAlgorithmBase** (p. 126).

References processCall().

8.103.3.8 `virtual std::string PyAlgo::GetOutputUnit () const` `[inline], [override], [virtual]`

Gets the unit of an output value returned by the 'Run' function.

Implements **bratl::CBratAlgorithmBase** (p. 126).

References processCall().

8.103.3.9 `template<typename T> static T& PyAlgo::processCall (PyObject * py_result, T & result)` `[inline], [static], [protected]`

Method to process the result of a method call.

Returns

result Result after conversion to proper data type.

Referenced by GetDescription(), GetInputParamDesc(), GetInputParamFormat(), GetInputParamUnit(), GetName(), GetNumInputParam(), GetOutputUnit(), and Run().

8.103.3.10 `virtual double PyAlgo::Run (CVectorBratAlgorithmParam & args) [inline],[override],
[virtual]`

Runs the algorithm

Parameters

<i>fmt</i>	[in] : a std::string that indicates the format of each value of input parameters (number, std::string) : d for integer l for long integer f for double s for std::string
<i>args</i>	[in] : the values of input parameters i(a C/C++ va_list).

Returns

the result of the execution

Implements **brathl::CBratAlgorithmBase** (p. 126).

References `createPyArguments()`, and `processCall()`.

The documentation for this class was generated from the following file:

- `PythonEngine.hpp`

8.104 PythonEngine Class Reference

Definition of the object to hold the Python Interpreter and respective methods.

```
#include <PythonEngine.hpp>
```

Public Member Functions

- `bool evaluate (const std::string &expression) const`
- `PyObject * getObject (const std::string &name) const`

Static Public Member Functions

9.1.1 Detailed Description

C/C++ general interface of BRATHL

9.1.2 Macro Definition Documentation

9.1.2.1 `#define BRATHL_CYCLE_LEN 60`

Maximum length of date reference string

9.1.2.2 `#define BRATHL_MAX_ERRMSG_LEN 255`

Maximum length of error message string

9.1.2.3 `#define BRATHL_REF_DATE_USER_LEN 28`

Maximum length of date reference string

Referenced by `FTN_NAME()`.

9.1.3 Typedef Documentation

9.1.3.1 typedef struct **_structDateDSM** brathl_DateDSM

Day/seconds/microseconds date structureCreates a type name for **_structDateDSM** (p. 99)

9.1.3.2 typedef struct **_structDateJulian** brathl_DateJulian

Decimal julian date structureCreates a type name for **_structDateJulian** (p. 100)

9.1.3.3 typedef struct **_structDateSecond** brathl_DateSecond

Decimal seconds date structureCreates a type name for **_structDateSecond** (p. 101)

9.1.3.4 typedef struct **_structDateYMDHMSM** brathl_DateYMDHMSM

YYYY-MM-DD HH:MM:SS:MS date structureCreates a type name for **_structDateYMDHMSM** (p. 101)

9.1.3.5 typedef int brathl_mission

Satellite (mission) ID -> On Brat V.4, mission ID is defined on txt file CMission::m_refFileName

9.1.4 Enumeration Type Documentation

9.1.4.1 enum brathl_FileMode

Enumerator:

Write file exists, open read-only

Replace file exists, open for writing

New create new file, even if it already exists create new file, fail if it already exists

9.1.4.2 enum brathl_refDate

date reference enumeration Used to give a date a a start reference User can defined its own reference by using REFUSER1 and/or REFUSER2

Enumerator:

REF19500101 reference to the 1950-01-01 00:00:00:00

REF19580101 reference to the 1958-01-01 00:00:00:00

REF19850101 reference to the 1985-01-01 00:00:00:00

REF19900101 reference to the 1990-01-01 00:00:00:00

REF20000101 reference to the 2000-01-01 00:00:00:00

REFUSER1 reference to a user-defined date **brathl_refDateUser1** (p. 341)

REFUSER2 reference to a second user-defined date **brathl_refDateUser2** (p. 341)

9.1.5 Variable Documentation

9.1.5.1 LIBRATHL_API char brathl_refDateUser1[BRATHL_REF_DATE_USER_LEN]

Global variable to define REFUSER1 date (see **brathl_refDate** (p. 341))

Referenced by brathl::CDate::ConstructDate(), and FTN_NAME().

9.1.5.2 LIBRATHL_API char brathl_refDateUser2[BRATHL_REF_DATE_USER_LEN]

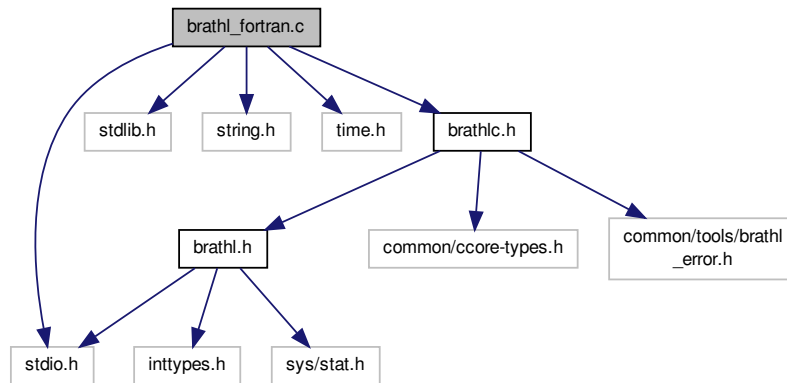

Global variable to define REFUSER2 date (see **brathl_refDate** (p. 341))

Referenced by brathl::CDate::ConstructDate(), and FTN_NAME().

9.2 brathl_fortran.c File Reference

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <time.h>
#include "brathlc.h"
```

Include dependency graph for brathl_fortran.c:

Macros

Variables

- LIBRATHL_API int **brathl_errno**

9.3.1 Detailed Description

C general interface of BRATHL

9.3.2 Function Documentation

9.3.2.1 LIBRATHL_API const char* brathl_Errno2String (const int32_t err)

Retrieve a string with the error description

With a few exceptions almost all BRATHL functions return an integer that indicate whether the function was able to perform its operations successfully. The return value will be 0 on success and < 0 otherwise. The result is also save in the global variable **brathl_errno** (p. 345) In case you get a negative value.

Parameters

<i>in</i>	<i>err</i> : error code
-----------	-------------------------

Returns

string error description

9.3.3 Variable Documentation

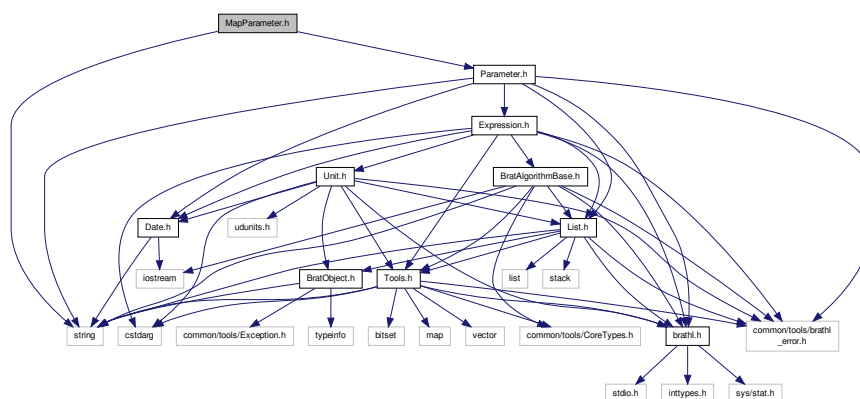

9.3.3.1 LIBRATHL_API int brathl_errno

Global variable to save error code

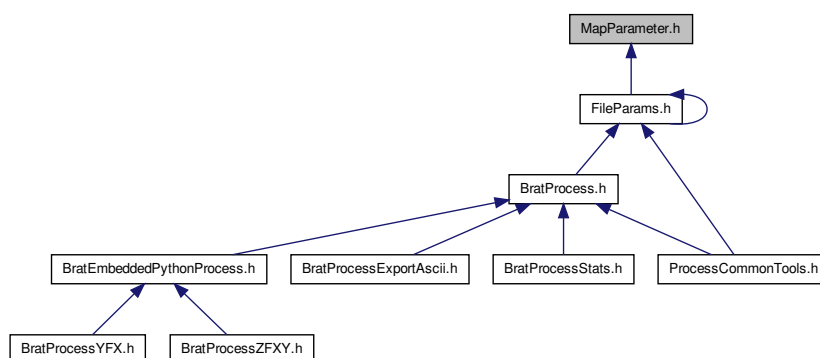

9.4 MapParameter.h File Reference

```
#include <string>
#include "Parameter.h"
```

Include dependency graph for MapParameter.h:
